

# Package ‘Giotto’

December 15, 2019

**Title** Spatial single-cell transcriptomics pipeline.

**Version** 0.1.4

**Description** Pipeline to process, analyze and visualize (spatial) single-cell expression data.

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.0.1

**Depends** data.table (>= 1.12.2),  
ggplot2 (>= 3.1.1),  
base (>= 3.5.1),  
utils (>= 3.5.1),  
R (>= 3.5.1)

**Imports** Rtsne (>= 0.15),  
uwot (>= 0.0.0.9010),  
multinet (>= 3.0.2),  
FactoMineR (>= 1.34),  
factoextra (>= 1.0.5),  
cowplot (>= 0.9.4),  
grDevices,  
RColorBrewer (>= 1.1-2),  
jackstraw (>= 1.3),  
dbscan (>= 1.1-3),  
ggalluvial (>= 0.9.1),  
scales (>= 1.0.0),  
ComplexHeatmap (>= 1.20.0),  
qvalue (>= 2.14.1),  
lfa (>= 1.12.0),  
igraph (>= 1.2.4.1),  
plotly,  
reticulate,  
magrittr,  
limma,  
ggdendro,  
smfishHmrf,  
matrixStats (>= 0.55.0),  
IRanges,  
devtools,  
reshape2,

ggraph  
**Suggests** knitr,  
 rmarkdown,  
 MAST,  
 scran ( $\geq 1.10.1$ ),  
 png,  
 tiff,  
 biomaRt  
**biocViews**  
**VignetteBuilder** knitr  
**Remotes** lambdamoses/smfishhmr-r

## R topics documented:

|                 |                        |
|-----------------|------------------------|
| addCellMetadata | <i>addCellMetadata</i> |
|-----------------|------------------------|

---

## Description

adds cell metadata to the giotto object

## Usage

```
addCellMetadata(  
  gobject,  
  new_metadata,  
  by_column = FALSE,  
  column_cell_ID = NULL  
)
```

## Arguments

|                |   |
|----------------|---|
| gobject        | giotto object   |
| new_metadata   | new cell metadata to use (data.table, data.frame, ...)              |
| by_column      | merge metadata based on cell_ID column in pDataDT (default = FALSE) |
| column_cell_ID | column name of new metadata to use if by_column = TRUE              |

## Details

You can add additional cell metadata in two manners: 1. Provide a data.table or data.frame with cell annotations in the same order as the cell\_ID column in pDataDT(gobject) 2. Provide a data.table or data.frame with cell annotations and specify which column contains the cell IDs, these cell IDs need to match with the cell\_ID column in pDataDT(gobject)

## Value

giotto object

## Examples

```
addCellMetadata(gobject)
```

---

|                   |                          |
|-------------------|--------------------------|
| addCellStatistics | <i>addCellStatistics</i> |
|-------------------|--------------------------|

---

## Description

adds cells statistics to the giotto object

**Usage**

```
addCellStatistics(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  detection_threshold = 0,
  return_gobject = TRUE
)
```

**Arguments**

gobject                  giotto object

expression\_values                  expression values to use

detection\_threshold                  detection threshold to consider a gene detected

return\_gobject    boolean: return giotto object (default = TRUE)

**Details**

This function will add the following statistics to cell metadata:

- nr\_genes: Denotes in how many genes are detected per cell
- perc\_genes: Denotes what percentage of genes is detected per cell
- total\_expr: Shows the total sum of gene expression per cell

**Value**

giotto object if return\_gobject = TRUE

**Examples**

```
addCellStatistics(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| addGeneMetadata | <i>addGeneMetadata</i> |
|-----------------|------------------------|

---

**Description**

adds gene metadata to the giotto object

**Usage**

```
addGeneMetadata(gobject, new_metadata, by_column = F, column_gene_ID = NULL)
```

**Arguments**

gobject                  giotto object

new\_metadata    new metadata to use

by\_column                  merge metadata based on gene\_ID column in fDataDT

column\_cell\_ID    column name of new metadata to use if by\_ID = TRUE

## Details

You can add additional gene metadata in two manners: 1. Provide a data.table or data.frame with gene annotations in the same order as the gene\_ID column in fDataDT(gobject) 2. Provide a data.table or data.frame with gene annotations and specify which column contains the gene IDs, these gene IDs need to match with the gene\_ID column in fDataDT(gobject)

## Value

giotto object

## Examples

```
addGeneMetadata(gobject)
```

---

|                   |                          |
|-------------------|--------------------------|
| addGeneStatistics | <i>addGeneStatistics</i> |
|-------------------|--------------------------|

---

## Description

adds gene statistics to the giotto object

## Usage

```
addGeneStatistics(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  detection_threshold = 0,
  return_gobject = TRUE
)
```

## Arguments

gobject            giotto object

expression\_values            expression values to use

detection\_threshold            detection threshold to consider a gene detected

return\_gobject    boolean: return giotto object (default = TRUE)

## Details

This function will add the following statistics to gene metadata:

- nr\_cells: Denotes in how many cells the gene is detected
- per\_cells: Denotes in what percentage of cells the gene is detected
- total\_expr: Shows the total sum of gene expression in all cells
- mean\_expr: Average gene expression in all cells
- mean\_expr\_det: Average gene expression in cells with detectable levels of the gene

**Value**

giotto object if return\_gobject = TRUE

**Examples**

```
addGeneStatistics(gobject)
```

---

|         |                |
|---------|----------------|
| addHMRF | <i>addHMRF</i> |
|---------|----------------|

---

**Description**

Add selected results from doHMRF to the giotto object

**Usage**

```
addHMRF(gobject, HMRFOutput, k = NULL, betas_to_add = NULL, hmrf_name = NULL)
```

**Arguments**

|              |   |
|--------------|---|
| gobject      | giotto object                                     |
| HMRFOutput   | HMRF output from doHMRF()                         |
| k            | number of domains                                 |
| betas_to_add | results from different betas that you want to add |
| name         | specify a custom name                             |

**Details**

Description ...

**Value**

giotto object

**Examples**

```
addHMRF(gobject)
```

---

|                  |                         |
|------------------|-------------------------|
| addNetworkLayout | <i>addNetworkLayout</i> |
|------------------|-------------------------|

---

## Description

Add a network layout for a selected nearest neighbor network

## Usage

```
addNetworkLayout(  
  gobject,  
  nn_network_to_use = "sNN",  
  network_name = "sNN.pca",  
  layout_type = c("drl"),  
  options_list = NULL,  
  layout_name = "layout",  
  return_gobject = TRUE  
)
```

## Arguments

|                   |  |
|-------------------|--|
| gobject           | giotto object                                  |
| nn_network_to_use | kNN or sNN                                     |
| network_name      | name of NN network to be used                  |
| layout_type       | layout algorithm to use                        |
| options_list      | list of options for selected layout            |
| layout_name       | name for layout                                |
| return_gobject    | boolean: return giotto object (default = TRUE) |

## Details

This function creates layout coordinates based on the provided kNN or sNN. Currently only the force-directed graph layout "drl", see [layout\\_with\\_drl](#), is implemented. This provides an alternative to tSNE or UMAP based visualizations.

## Value

giotto object with updated layout for selected NN network

## Examples

```
addNetworkLayout(gobject)
```

---

|               |                      |
|---------------|----------------------|
| addStatistics | <i>addStatistics</i> |
|---------------|----------------------|

---

### Description

adds genes and cells statistics to the giotto object

### Usage

```
addStatistics(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  detection_threshold = 0,
  return_gobject = TRUE
)
```

### Arguments

gobject            giotto object

expression\_values  
                  expression values to use

detection\_threshold  
                  detection threshold to consider a gene detected

return\_gobject    boolean: return giotto object (default = TRUE)

### Details

See [addGeneStatistics](#) and [addCellStatistics](#)

### Value

giotto object if return\_gobject = TRUE, else a list with results

### Examples

```
addStatistics(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| adjustGiottoMatrix | <i>adjustGiottoMatrix</i> |
|--------------------|---------------------------|

---

### Description

normalize and/or scale expresion values of Giotto object

**Usage**

```
adjustGiottoMatrix(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  batch_columns = NULL,
  covariate_columns = NULL,
  return_gobject = TRUE,
  update_slot = c("custom")
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object   |
| <code>expression_values</code> | expression values to use                                  |
| <code>batch_columns</code>     | metadata columns that represent different batch (max = 2) |
| <code>covariate_columns</code> | metadata columns that represent covariates to regress out |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE)            |
| <code>update_slot</code>       | expression slot that will be updated (default = custom)   |

**Details**

This function implements the [limma::removeBatchEffect](#) function to remove known batch effects and to adjust expression values according to provided covariates.

**Value**

giotto object

**Examples**

```
adjustGiottoMatrix(gobject)
```

---

aes\_string2

*aes\_string2*

---

**Description**

makes sure aes\_string can also be used with names that start with numeric values

**Usage**

```
aes_string2(...)
```

---

```
allCellCellcommunicationsScores
      allCellCellcommunicationsScores
```

---

### Description

All Cell-Cell communication scores based on spatial expression of interacting cells

### Usage

```
allCellCellcommunicationsScores(
  gobject,
  spatial_network_name = "spatial_network",
  cluster_column = "cell_types",
  random_iter = 100,
  gene_set_1,
  gene_set_2,
  log2FC_addendum = 0.1,
  min_observations = 2,
  verbose = c("a little", "a lot", "none")
)
```

### Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object to use                                     |
| <code>spatial_network_name</code> | spatial network to use for identifying interacting cells |
| <code>cluster_column</code>       | cluster column with cell type information                |
| <code>random_iter</code>          | number of iterations                                     |
| <code>gene_set_1</code>           | first specific gene set from gene pairs                  |
| <code>gene_set_2</code>           | second specific gene set from gene pairs                 |
| <code>log2FC_addendum</code>      | addendum to add when calculating log2FC                  |
| <code>min_observations</code>     | minimum number of interactions needed to be considered   |
| <code>verbose</code>              | verbose  |

### Details

Statistical framework to identify if pairs of genes (such as ligand-receptor combinations) are expressed at higher levels than expected based on a reshuffled null distribution of gene expression values in cells that are spatially in proximity to eachother.. More details will follow soon.

### Value

Cell-Cell communication scores for gene pairs based on spatial interaction

### Examples

```
allCellCellcommunicationsScores(gobject)
```

---

```
all_plots_save_function
    all_plots_save_function
```

---

## Description

Function to automatically save plots to directory of interest

## Usage

```
all_plots_save_function(
  gobject,
  plot_object,
  save_dir = NULL,
  save_folder = NULL,
  save_name = NULL,
  default_save_name = "giotto_plot",
  save_format = NULL,
  show_saved_plot = F,
  ncol = 1,
  nrow = 1,
  scale = 1,
  base_width = NULL,
  base_height = NULL,
  base_aspect_ratio = NULL,
  units = NULL,
  dpi = NULL,
  limitsize = TRUE,
  ...
)
```

## Arguments

|                   |                                   |
|-------------------|-----------------------------------|
| gobject           | giotto object                     |
| plot_object       | object to plot                    |
| save_dir          | directory to save to              |
| save_folder       | folder in save_dir to save to     |
| save_name         | name of plot                      |
| save_format       | format (e.g. png, tiff, pdf, ...) |
| show_saved_plot   | load & display the saved plot     |
| ncol              | number of columns                 |
| nrow              | number of rows                    |
| scale             | scale                             |
| base_width        | width                             |
| base_height       | height                            |
| base_aspect_ratio | aspect ratio                      |

|           |  |
|-----------|--|
| units     | units  |
| dpi       | Plot resolution  |
| limitsize | When TRUE (the default), ggsave will not save images larger than 50x50 inches, to prevent the common error of specifying dimensions in pixels. |
| ...       | additional parameters to ggplot_save_function or general_save_function   |

**See Also**

[general\\_save\\_function](#)

**Examples**

```
all_plots_save_function(gobject)
```

---

|                |                       |
|----------------|-----------------------|
| annotateGiotto | <i>annotateGiotto</i> |
|----------------|-----------------------|

---

**Description**

Converts cluster results into provided annotation.

**Usage**

```
annotateGiotto(
  gobject,
  annotation_vector = NULL,
  cluster_column = NULL,
  name = "cell_types"
)
```

**Arguments**

|                   |   |
|-------------------|---|
| gobject           | giotto object                                 |
| annotation_vector | named annotation vector (names = cluster ids) |
| cluster_column    | cluster column to convert to annotation names |
| name              | new name for annotation column                |

**Details**

You need to specify which (cluster) column you want to annotate and you need to provide an annotation vector like this:

- 1. identify the cell type of each cluster
- 2. create a vector of these cell types, e.g. `cell_types = c('T-cell', 'B-cell', 'Stromal')`
- 3. provide original cluster names to previous vector, e.g. `names(cell_types) = c(2, 1, 3)`

**Value**

giotto object

## Examples

```
annotateGiotto(gobject)
```

---

```
annotateSpatialNetwork
```

```
annotateSpatialNetwork
```

---

## Description

Annotate spatial network with cell metadata information.

## Usage

```
annotateSpatialNetwork(  
  gobject,  
  spatial_network_name = "spatial_network",  
  cluster_column  
)
```

## Arguments

```
gobject      giotto object  
spatial_network_name  
              name of spatial network to use  
cluster_column name of column to use for clusters
```

## Value

annotated network in data.table format

## Examples

```
annotateSpatialNetwork(gobject)
```

---

```
annotate_spatlocs_with_spatgrid_2D
```

```
annotate_spatlocs_with_spatgrid_2D
```

---

## Description

annotate spatial locations with 2D spatial grid information

## Usage

```
annotate_spatlocs_with_spatgrid_2D(spatloc, spatgrid)
```

## Arguments

```
spatloc      spatial_locs slot from giotto object  
spatgrid     selected spatial_grid slot from giotto object
```

**Value**

annotated spatial location data.table

**Examples**

```
annotate_spatlocs_with_spatgrid_2D()
```

---

```
annotate_spatlocs_with_spatgrid_3D
```

```
annotate_spatlocs_with_spatgrid_3D
```

---

**Description**

annotate spatial locations with 3D spatial grid information

**Usage**

```
annotate_spatlocs_with_spatgrid_3D(spatloc, spatgrid)
```

**Arguments**

spatloc                spatial\_locs slot from giotto object

spatgrid              selected spatial\_grid slot from giotto object

**Value**

annotated spatial location data.table

**Examples**

```
annotate_spatlocs_with_spatgrid_3D()
```

---

```
average_gene_gene_expression_in_groups
```

```
average_gene_gene_expression_in_groups
```

---

**Description**

calculate average expression per cluster

**Usage**

```
average_gene_gene_expression_in_groups(  
  gobject,  
  cluster_column = "cell_types",  
  gene_set_1,  
  gene_set_2  
)
```

**Arguments**

|                             |   |
|-----------------------------|---|
| <code>gobject</code>        | giotto object to use                      |
| <code>cluster_column</code> | cluster column with cell type information |
| <code>gene_set_1</code>     | first specific gene set from gene pairs   |
| <code>gene_set_2</code>     | second specific gene set from gene pairs  |

**Details**

Details will follow soon.

**Value**

data.table with average expression scores for each cluster

**Examples**

```
average_gene_gene_expression_in_groups(gobject)
```

---

|                                 |                           |
|---------------------------------|---------------------------|
| <code>binGetSpatialGenes</code> | <i>binGetSpatialGenes</i> |
|---------------------------------|---------------------------|

---

**Description**

Rapid computation of genes that are spatially clustered

**Usage**

```
binGetSpatialGenes(
  gobject,
  bin_method = c("kmeans", "rank"),
  expression_values = c("normalized", "scaled", "custom"),
  subset_genes = NULL,
  spatial_network_name = "spatial_network",
  nstart = 3,
  iter_max = 10,
  percentage_rank = 10,
  do_fisher_test = F,
  community_expectation = 5,
  verbose = F
)
```

**Arguments**

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>bin_method</code>           | method to binarize gene expression                           |
| <code>expression_values</code>    | expression values to use                                     |
| <code>subset_genes</code>         | only select a subset of genes to test                        |
| <code>spatial_network_name</code> | name of spatial network to use (default = 'spatial_network') |

|                       |  |
|-----------------------|--|
| nstart                | kmeans: nstart parameter                       |
| iter_max              | kmeans: iter.max parameter                     |
| do_fisher_test        | perform fisher test                            |
| community_expectation | cell degree expectation in spatial communities |
| verbose               | be verbose                                     |
| rank_percentage       | percentage of top cells for binarization       |

## Details

We provide two ways to identify spatial genes based on gene expression binarization. Both methods are identical except for how binarization is performed.

- 1. binarize: Each gene is binarized (0 or 1) in each cell with **kmeans** ( $k = 2$ ) or based on **rank** percentile
- 2. network: All cells are connected through a k-nearest neighbor network
- 3. contingency table: A contingency table is calculated based on all pairwise cell-cell interactions (0-0, 0-1, 1-0 or 1-1)
- 4. For each gene an odds-ratio (OR) and fisher.test (optional) is calculated

Additionally 2 other statistics are provided:

- Number of cells with high expression (binary = 1)
- total and ratio of highly connected cells: Cells with a connectivity higher than community\_expectation

By selecting a subset of likely spatial genes (e.g. highly variable genes) the function will be much faster.

## Value

data.table with results (see details)

## Examples

```
binGetSpatialGenes(gobject)
```

---

calculateHVG

*calculateHVG*

---

## Description

compute highly variable genes

**Usage**

```
calculateHVG(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  method = c("cov_groups", "cov_loess"),
  reverse_log_scale = FALSE,
  logbase = 2,
  expression_threshold = 0,
  nr_expression_groups = 20,
  zscore_threshold = 1.5,
  HVGname = "hvg",
  difference_in_cov = 0.1,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "HVGplot",
  return_gobject = TRUE
)
```

**Arguments**

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>expression_values</code>    | expression values to use   |
| <code>method</code>               | method to calculate highly variable genes  |
| <code>reverse_log_scale</code>    | reverse log-scale of expression values (default = FALSE)   |
| <code>logbase</code>              | if <code>reverse_log_scale</code> is TRUE, which log base was used?                                  |
| <code>expression_threshold</code> | expression threshold to consider a gene detected   |
| <code>nr_expression_groups</code> | number of expression groups for <code>cov_groups</code>  |
| <code>zscore_threshold</code>     | zscore to select hvg for <code>cov_groups</code>   |
| <code>HVGname</code>              | name for highly variable genes in cell metadata  |
| <code>difference_in_cov</code>    | minimum difference in coefficient of variance required   |
| <code>show_plot</code>            | show plot  |
| <code>return_plot</code>          | return ggplot object   |
| <code>save_plot</code>            | directly save the plot [boolean]   |
| <code>save_param</code>           | list of saving parameters from <a href="#">all_plots_save_function</a>                               |
| <code>default_save_name</code>    | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>return_gobject</code>       | boolean: return giotto object (default = TRUE)   |

## Details

Currently we provide 2 ways to calculate highly variable genes: **1. high coeff of variance (COV) within groups:**

First genes are binned (*nr\_expression\_groups*) into average expression groups and the COV for each gene is converted into a z-score within each bin. Genes with a z-score higher than the threshold (*zscore\_threshold*) are considered highly variable.

### 2. high COV based on loess regression prediction:

A predicted COV is calculated for each gene using loess regression (COV~log(mean expression)) Genes that show a higher than predicted COV (*difference\_in\_cov*) are considered highly variable.

## Value

giotto object highly variable genes appended to gene metadata (fDataDT)

## Examples

```
calculateHVG(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| calculateMetaTable | <i>calculateMetaTable</i> |
|--------------------|---------------------------|

---

## Description

calculates the average gene expression for one or more (combined) annotation columns.

## Usage

```
calculateMetaTable(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  metadata_cols = NULL,
  selected_genes = NULL
)
```

## Arguments

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object                                |
| <code>expression_values</code> | expression values to use                     |
| <code>metadata_cols</code>     | annotation columns found in pDataDT(gobject) |
| <code>selected_genes</code>    | subset of genes to use                       |

## Value

data.table with average expression values for each gene per (combined) annotation

## Examples

```
calculateMetaTable(gobject)
```

---

```
calculateMetaTableCells
      calculateMetaTableCells
```

---

**Description**

calculates the average metadata values for one or more (combined) annotation columns.

**Usage**

```
calculateMetaTableCells(
  gobject,
  value_cols = NULL,
  metadata_cols = NULL,
  spat_enr_names = NULL
)
```

**Arguments**

|                |  |
|----------------|--|
| gobject        | giotto object                                |
| value_cols     | metadata or enrichment value columns to use  |
| metadata_cols  | annotation columns found in pDataDT(gobject) |
| spat_enr_names | which spatial enrichment results to include  |

**Value**

data.table with average metadata values per (combined) annotation

**Examples**

```
calculateMetaTableCells(gobject)
```

---

```
calculate_spatial_genes_python
      calculate_spatial_genes_python
```

---

**Description**

Calculate spatial genes using distance matrix.

**Usage**

```
calculate_spatial_genes_python(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  metric = "euclidean",
  subset_genes = NULL,
  rbp_p = 0.95,
  examine_top = 0.3,
  python_path = NULL
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object                               |
| <code>expression_values</code> | expression values to use                    |
| <code>metric</code>            | distance metric to use                      |
| <code>subset_genes</code>      | only run on this subset of genes            |
| <code>rbp_p</code>             | fractional binarization threshold           |
| <code>examine_top</code>       | top fraction to evaluate with silhouette    |
| <code>python_path</code>       | specify specific path to python if required |

**Details**

Description of how we compute spatial pattern genes.

**Value**

data.table with spatial scores

**Examples**

```
calculate_spatial_genes_python(gobject)
```

---

`cellProximityBarplot`    *cellProximityBarplot*

---

**Description**

Create barplot from cell-cell proximity scores

**Usage**

```
cellProximityBarplot(
  gobject,
  CPscore,
  min_orig_ints = 5,
  min_sim_ints = 5,
  p_val = 0.05,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "cellProximityBarplot"
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object  |
| <code>CPscore</code>           | CPscore, output from <code>cellProximityEnrichment()</code>  |
| <code>min_orig_ints</code>     | filter on minimum original cell-cell interactions  |
| <code>min_sim_ints</code>      | filter on minimum simulated cell-cell interactions   |
| <code>p_val</code>             | p-value  |
| <code>show_plot</code>         | show plot  |
| <code>return_plot</code>       | return ggplot object   |
| <code>save_plot</code>         | directly save the plot [boolean]   |
| <code>save_param</code>        | list of saving parameters from <a href="#">all_plots_save_function</a>                               |
| <code>default_save_name</code> | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |

**Details**

This function creates a barplot that shows the spatial proximity enrichment or depletion of cell type pairs.

**Value**

ggplot barplot

**Examples**

```
cellProximityBarplot(CPscore)
```

---

```
cellProximityEnrichment
```

```
cellProximityEnrichment
```

---

**Description**

Compute cell-cell interaction enrichment (observed vs expected)

**Usage**

```
cellProximityEnrichment(
  gobject,
  spatial_network_name = "spatial_network",
  cluster_column,
  number_of_simulations = 100
)
```

**Arguments**

|                                    |   |
|------------------------------------|---|
| <code>gobject</code>               | giotto object   |
| <code>spatial_network_name</code>  | name of spatial network to use                        |
| <code>cluster_column</code>        | name of column to use for clusters                    |
| <code>number_of_simulations</code> | number of simulations to create expected observations |

## Details

Spatial proximity enrichment or depletion between pairs of cell types is calculated by calculating the observed over the expected frequency of cell-cell proximity interactions. The expected frequency is the average frequency calculated from a number of spatial network simulations. Each individual simulation is obtained by reshuffling the cell type labels of each node (cell) in the spatial network.

## Value

List of cell Proximity scores (CPscores) in data.table format. The first data.table (raw\_sim\_table) shows the raw observations of both the original and simulated networks. The second data.table (enrichm\_res) shows the enrichment results.

## Examples

```
cellProximityEnrichment(gobject)
```

---

|                      |                             |
|----------------------|-----------------------------|
| cellProximityHeatmap | <i>cellProximityHeatmap</i> |
|----------------------|-----------------------------|

---

## Description

Create heatmap from cell-cell proximity scores

## Usage

```
cellProximityHeatmap(
  gobject,
  CPscore,
  scale = T,
  order_cell_types = T,
  color_breaks = NULL,
  color_names = NULL,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "cellProximityHeatmap"
)
```

## Arguments

|                  |   |
|------------------|---|
| gobject          | giotto object   |
| CPscore          | CPscore, output from cellProximityEnrichment()                  |
| scale            | scale cell-cell proximity interaction scores                    |
| order_cell_types | order cell types based on enrichment correlation                |
| color_breaks     | numerical vector of length 3 to represent min, mean and maximum |
| color_names      | character color vector of length 3                              |
| show_plot        | show plot   |

|                   |  |
|-------------------|--|
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]   |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name | default save name for saving, don't change, change save_name in save_param |

## Details

This function creates a heatmap that shows the spatial proximity enrichment or depletion of cell type pairs.

## Value

ggplot heatmap

## Examples

```
cellProximityHeatmap(CPscore)
```

---

|                      |                             |
|----------------------|-----------------------------|
| cellProximityNetwork | <i>cellProximityNetwork</i> |
|----------------------|-----------------------------|

---

## Description

Create network from cell-cell proximity scores

## Usage

```
cellProximityNetwork(
  gobject,
  CPscore,
  remove_self_edges = FALSE,
  self_loop_strength = 0.1,
  color_depletion = "lightgreen",
  color_enrichment = "red",
  rescale_edge_weights = TRUE,
  edge_weight_range_depletion = c(0.1, 1),
  edge_weight_range_enrichment = c(1, 5),
  layout = "Fruchterman",
  only_show_enrichment_edges = F,
  edge_width_range = c(0.1, 2),
  node_size = 4,
  node_text_size = 6,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "cellProximityNetwork"
)
```

**Arguments**

|   |  |
|---|--|
| <code>gobject</code>                      | giotto object  |
| <code>CPscore</code>                      | CPscore, output from <code>cellProximityEnrichment()</code>  |
| <code>remove_self_edges</code>            | remove enrichment/depletion edges with itself  |
| <code>self_loop_strength</code>           | size of self-loops   |
| <code>color_depletion</code>              | color for depleted cell-cell interactions  |
| <code>color_enrichment</code>             | color for enriched cell-cell interactions  |
| <code>rescale_edge_weights</code>         | rescale edge weights (boolean)   |
| <code>edge_weight_range_depletion</code>  | numerical vector of length 2 to rescale depleted edge weights  |
| <code>edge_weight_range_enrichment</code> | numerical vector of length 2 to rescale enriched edge weights  |
| <code>layout</code>                       | layout algorithm to use to draw nodes and edges  |
| <code>only_show_enrichment_edges</code>   | show only the enriched pairwise scores   |
| <code>edge_width_range</code>             | range of edge width  |
| <code>node_size</code>                    | size of nodes  |
| <code>node_text_size</code>               | size of node labels  |
| <code>show_plot</code>                    | show plot  |
| <code>return_plot</code>                  | return ggplot object   |
| <code>save_plot</code>                    | directly save the plot [boolean]   |
| <code>save_param</code>                   | list of saving parameters from <a href="#">all_plots_save_function</a>                               |
| <code>default_save_name</code>            | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |

**Details**

This function creates a network that shows the spatial proximity enrichment or depletion of cell type pairs.

**Value**

igraph plot

**Examples**

```
cellProximityNetwork(CPscore)
```

---

cellProximitySpatPlot *cellProximitySpatPlot*

---

## Description

Visualize 2D cell-cell interactions according to spatial coordinates in ggplot mode

## Usage

```
cellProximitySpatPlot(gobject, ...)
```

## Arguments

|   |   |
|---|---|

**Details**

Description of parameters.

**Value**

plotly

**Examples**

```
cellProximityVisPlot_3D_plotly(gobject)
```

---

changeGiottoInstructions

*changeGiottoInstructions*

---

**Description**

Function to change one or more instructions from giotto object

**Usage**

```
changeGiottoInstructions(
  gobject,
  params = NULL,
  new_values = NULL,
  return_gobject = TRUE
)
```

**Arguments**

|                             |                                |
|-----------------------------|--------------------------------|
| <code>gobject</code>        | giotto object                  |
| <code>params</code>         | parameter(s) to change         |
| <code>new_values</code>     | new value(s) for parameter(s)  |
| <code>return_gobject</code> | (boolean) return giotto object |

**Value**

named vector with giotto instructions

**Examples**

```
changeGiottoInstructions()
```

---

|                           |                     |
|---------------------------|---------------------|
| <code>clusterCells</code> | <i>clusterCells</i> |
|---------------------------|---------------------|

---

**Description**

cluster cells using a variety of different methods

**Usage**

```

```

### Arguments

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object                               |
| <code>cluster_method</code>       | community cluster method to use             |
| <code>name</code>                 | name for new clustering result              |
| <code>nn_network_to_use</code>    | type of NN network to use (kNN vs sNN)      |
| <code>network_name</code>         | name of NN network to use                   |
| <code>pyth_leid_resolution</code> | resolution for leiden                       |
| <code>pyth_leid_weight_col</code> | column to use for weights                   |
| <code>pyth_leid_part_type</code>  | partition type to use                       |
| <code>pyth_leid_init_memb</code>  | initial membership                          |
| <code>pyth_leid_iterations</code> | number of iterations                        |
| <code>pyth_louv_resolution</code> | resolution for louvain                      |
| <code>pyth_louv_weight_col</code> | python louvain param: weight column         |
| <code>python_louv_random</code>   | python louvain param: random                |
| <code>python_path</code>          | specify specific path to python if required |
| <code>louvain_gamma</code>        | louvain param: gamma or resolution          |
| <code>louvain_omega</code>        | louvain param: omega                        |
| <code>walk_steps</code>           | randomwalk: number of steps                 |
| <code>walk_clusters</code>        | randomwalk: number of clusters              |
| <code>walk_weights</code>         | randomwalk: weight column                   |
| <code>sNNclust_k</code>           | SNNclust: k neighbors to use                |

|                         |  |
|-------------------------|--|
| sNNclust_eps            | SNNclust: epsilon                              |
| sNNclust_minPts         | SNNclust: min points                           |
| borderPoints            | SNNclust: border points                        |
| expression_values       | expression values to use                       |
| genes_to_use            | = NULL,  |
| dim_reduction_to_use    | dimension reduction to use                     |
| dim_reduction_name      | name of reduction 'pca',                       |
| dimensions_to_use       | dimensions to use                              |
| distance_method         | distance method                                |
| km_centers              | kmeans centers                                 |
| km_iter_max             | kmeans iterations                              |
| km_nstart               | kmeans random starting points                  |
| km_algorithm            | kmeans algorithm                               |
| hc_agglomeration_method | hierarchical clustering method                 |
| hc_k                    | hierachical number of clusters                 |
| hc_h                    | hierarchical tree cutoff                       |
| return_gobject          | boolean: return giotto object (default = TRUE) |
| set_seed                | set seed                                       |
| seed_number             | number for seed                                |

### Details

Wrapper for the different clustering methods.

### Value

giotto object with new clusters appended to cell metadata

### See Also

[doLeidenCluster](#), [doLouvainCluster\\_community](#), [doLouvainCluster\\_multinet](#), [doLouvainCluster](#), [doRandomWalkCluster](#), [doSNNCluster](#), [doKmeans](#), [doHclust](#)

### Examples

```
clusterCells(gobject)
```

---

```
clusterSpatialCorGenes
      clusterSpatialCorGenes
```

---

**Description**

Cluster based on spatially correlated genes

**Usage**

```
clusterSpatialCorGenes(
  spatCorObject,
  name = "spat_clus",
  hclust_method = "ward.D",
  k = 10,
  return_obj = TRUE
)
```

**Arguments**

|               |   |
|---------------|---|
| spatCorObject | spatial correlation object                        |
| name          | name for spatial clustering results               |
| hclust_method | method for hierarchical clustering                |
| k             | number of clusters to extract                     |
| return_obj    | return spatial correlation object (spatCorObject) |

**Value**

spatCorObject or cluster results

**Examples**

```
clusterSpatialCorGenes(gobject)
```

---

```
combineMetadata      combineMetadata
```

---

**Description**

This function combines the cell metadata with spatial locations and enrichment results from createSpatialEnrich

**Usage**

```
combineMetadata(gobject, spat_enr_names = NULL)
```

**Arguments**

|                |  |
|----------------|--|
| gobject        | Giotto object                                  |
| spat_enr_names | names of spatial enrichment results to include |

**Value**

Extended cell metadata in data.table format.

**Examples**

```
combineMetadata(gobject)
```

---

```
convertEnsemblToGeneSymbol
```

```
convertEnsemblToGeneSymbol
```

---

**Description**

This function convert ensembl gene IDs from a matrix to official gene symbols

**Usage**

```
convertEnsemblToGeneSymbol(matrix, species = c("mouse", "human"))
```

**Arguments**

|                      |  |
|----------------------|--|
| <code>matrix</code>  | an expression matrix with ensembl gene IDs as rownames |
| <code>species</code> | species to use for gene symbol conversion              |

**Details**

This function requires that the biomaRt library is installed

**Value**

expression matrix with gene symbols as rownames

**Examples**

```
convertEnsemblToGeneSymbol(matrix)
```

---

```
createGiottoInstructions
```

```
createGiottoInstructions
```

---

**Description**

Function to set global instructions for giotto functions

**Usage**

```
createGiottoInstructions(
  python_path = NULL,
  show_plot = NULL,
  return_plot = NULL,
  save_plot = NULL,
  save_dir = NULL,
  plot_format = NULL,
  dpi = NULL,
  units = NULL,
  height = NULL,
  width = NULL
)
```

**Arguments**

|             |  |
|-------------|--|
| python_path | path to python binary to use             |
| show_plot   | print plot to console, default = TRUE    |
| return_plot | return plot as object, default = TRUE    |
| save_plot   | automatically save plot, default = FALSE |
| save_dir    | path to directory where to save plots    |
| dpi         | resolution for raster images             |
| height      | height of plots                          |
| width       | width of plots                           |

**Value**

named vector with giotto instructions

**Examples**

```
createGiottoInstructions()
```

---

|                    |                             |
|--------------------|-----------------------------|
| createGiottoObject | <i>create Giotto object</i> |
|--------------------|-----------------------------|

---

**Description**

Function to create a giotto object

**Usage**

```
createGiottoObject(
  raw_exprs,
  spatial_locs = NULL,
  norm_expr = NULL,
  norm_scaled_expr = NULL,
  custom_expr = NULL,
  cell_metadata = NULL,
```

```

gene_metadata = NULL,
spatial_network = NULL,
spatial_network_name = NULL,
spatial_grid = NULL,
spatial_grid_name = NULL,
spatial_enrichment = NULL,
spatial_enrichment_name = NULL,
dimension_reduction = NULL,
nn_network = NULL,
offset_file = NULL,
instructions = NULL
)

```

### Arguments

|                         |   |
|-------------------------|---|
| raw_exprs               | matrix with raw expression counts [required]                        |
| spatial_locs            | data.table or data.frame with coordinates for cell centroids        |
| norm_expr               | normalized expression values  |
| norm_scaled_expr        | scaled expression values  |
| custom_expr             | custom expression values  |
| cell_metadata           | cell annotation metadata  |
| gene_metadata           | gene annotation metadata  |
| spatial_network         | list of spatial network(s)  |
| spatial_network_name    | list of spatial network name(s)                                     |
| spatial_grid            | list of spatial grid(s)   |
| spatial_grid_name       | list of spatial grid name(s)  |
| spatial_enrichment      | list of spatial enrichment score(s) for each spatial region         |
| spatial_enrichment_name | list of spatial enrichment name(s)                                  |
| dimension_reduction     | list of dimension reduction(s)                                      |
| nn_network              | list of nearest neighbor network(s)                                 |
| offset_file             | file used to stitch fields together (optional)                      |
| instructions            | list of instructions or output result from createGiottoInstructions |

### Details

**[Requirements]** To create a giotto object you need to provide at least a matrix with genes as row names and cells as column names. To include spatial information about cells (or regions) you need to provide a data.table or data.frame with coordinates for all spatial dimensions. This can be 2D (x and y) or 3D (x, y, x). The row order for the cell coordinates should be the same as the column order for the provided expression data.

**[Instructions]** Additionally an instruction file, generated manually or with [createGiottoInstructions](#) can be provided to instructions, if not a default instruction file will be created for the Giotto object.

**[Multiple fields]** In case a dataset consists of multiple fields, like seqFISH+ for example, an offset file can be provided to stitch the different fields together. [stitchFieldCoordinates](#) can be used to generate such an offset file.

**[Processed data]** Processed count data, such as normalized data, can be provided using one of the different expression slots (norm\_expr, norm\_scaled\_expr, custom\_expr).

**[Metadata]** Cell and gene metadata can be provided using the cell and gene metadata slots. This data can also be added afterwards using the [addGeneMetadata](#) or [addCellMetadata](#) functions.

**[Other information]** Additional information can be provided through the appropriate slots:

- spatial networks
- spatial girds
- spatial enrichments
- dimensions reductions
- nearest neighbours networks

### Value

giotto object

### Examples

```
createGiottoObject(raw_exprs, spatial_locs)
```

---

|                  |                         |
|------------------|-------------------------|
| createHeatmap_DT | <i>createHeatmap_DT</i> |
|------------------|-------------------------|

---

### Description

creates order for clusters

### Usage

```
createHeatmap_DT(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  genes,
  cluster_column = NULL,
  cluster_order = c("size", "correlation", "custom"),
  cluster_custom_order = NULL,
  cluster_cor_method = "pearson",
  cluster_hclust_method = "ward.D",
  gene_order = c("custom", "correlation"),
  gene_custom_order = NULL,
  gene_cor_method = "pearson",
  gene_hclust_method = "complete"
)
```

**Arguments**

|                                    |  |
|------------------------------------|--|
| <code>gobject</code>               | giotto object                                  |
| <code>expression_values</code>     | expression values to use                       |
| <code>genes</code>                 | genes to use                                   |
| <code>cluster_column</code>        | name of column to use for clusters             |
| <code>cluster_order</code>         | method to determine cluster order              |
| <code>cluster_custom_order</code>  | custom order for clusters                      |
| <code>cluster_cor_method</code>    | method for cluster correlation                 |
| <code>cluster_hclust_method</code> | method for hierarchical clustering of clusters |
| <code>gene_order</code>            | method to determine gene order                 |
| <code>gene_custom_order</code>     | custom order for genes                         |
| <code>gene_cor_method</code>       | method for gene correlation                    |
| <code>gene_hclust_method</code>    | method for hierarchical clustering of genes    |

**Details**

Creates input data.tables for plotHeatmap function.

**Value**

list

**Examples**

```
createHeatmap_DT(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| createMetagenes | <i>createMetagenes</i> |
|-----------------|------------------------|

---

**Description**

This function creates an average metagene for gene clusters.

**Usage**

```
createMetagenes(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  gene_clusters,
  name = "metagene",
  return_gobject = TRUE
)
```

**Arguments**

|                                |                                      |
|--------------------------------|--------------------------------------|
| <code>gobject</code>           | Giotto object                        |
| <code>expression_values</code> | expression values to use             |
| <code>gene_clusters</code>     | numerical vector with genes as names |
| <code>name</code>              | name of the metagene results         |
| <code>return_gobject</code>    | return giotto object                 |

**Details**

An example for the 'gene\_clusters' could be like this: `cluster_vector = c(1, 1, 2, 2); names(cluster_vector) = c('geneA', 'geneB', 'geneC', 'geneD')`

**Value**

giotto object

**Examples**

```
createMetagenes(gobject)
```

---

```
createNearestNetwork    createNearestNetwork
```

---

**Description**

create a nearest neighbour (NN) network

**Usage**

```
createNearestNetwork(
  gobject,
  type = c("sNN", "kNN"),
  dim_reduction_to_use = "pca",
  dim_reduction_name = "pca",
  dimensions_to_use = 1:10,
  genes_to_use = NULL,
  expression_values = c("normalized", "scaled", "custom"),
  name = "sNN.pca",
  return_gobject = TRUE,
  k = 30,
  minimum_shared = 5,
  top_shared = 3,
  verbose = T,
  ...
)
```

**Arguments**

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>type</code>                 | sNN or kNN   |
| <code>dim_reduction_to_use</code> | dimension reduction method to use                                |
| <code>dim_reduction_name</code>   | name of dimension reduction set to use                           |
| <code>dimensions_to_use</code>    | number of dimensions to use as input                             |
| <code>genes_to_use</code>         | if <code>dim_reduction_to_use = NULL</code> , which genes to use |
| <code>expression_values</code>    | expression values to use   |
| <code>name</code>                 | arbitrary name for NN network                                    |
| <code>return_gobject</code>       | boolean: return giotto object (default = TRUE)                   |
| <code>k</code>                    | number of k neighbors to use                                     |
| <code>minimum_shared</code>       | minimum shared neighbors   |
| <code>top_shared</code>           | keep at ...  |
| <code>verbose</code>              | be verbose   |
| <code>...</code>                  | additional parameters for kNN and sNN functions from dbscan      |

**Details**

This function creates a k-nearest neighbour (kNN) or shared nearest neighbour (sNN) network based on the provided dimension reduction space. To run it directly on the gene expression matrix set `dim_reduction_to_use = NULL`.

See also [kNN](#) and [sNN](#) for more information about how the networks are created.

Output for kNN:

- from: `cell_ID` for source cell
- to: `cell_ID` for target cell
- distance: distance between cells
- weight:  $\text{weight} = 1/(1 + \text{distance})$

Output for sNN:

- from: `cell_ID` for source cell
- to: `cell_ID` for target cell
- distance: distance between cells
- weight:  $1/(1 + \text{distance})$
- shared: number of shared neighbours
- rank: ranking of pairwise cell neighbours

For sNN networks two additional parameters can be set:

- `minimum_shared`: minimum number of shared neighbours needed
- `top_shared`: keep this number of the top shared neighbours, irrespective of `minimum_shared` setting

**Value**

giotto object with updated NN network

**Examples**

```
createNearestNetwork(gobject)
```

---

```
createSpatialEnrich     createSpatialEnrich
```

---

**Description**

Function to calculate gene signature enrichment scores per spatial position using a hypergeometric test.

**Usage**

```
createSpatialEnrich(
  gobject,
  enrich_method = c("PAGE", "rank", "hypergeometric"),
  sign_matrix,
  expression_values = c("normalized", "scaled", "custom"),
  reverse_log_scale = TRUE,
  logbase = 2,
  output_enrichment = c("original", "zscore"),
  name = "PAGE",
  return_gobject = TRUE
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | Giotto object  |
| <code>enrich_method</code>     | method for gene signature enrichment calculation         |
| <code>sign_matrix</code>       | Matrix of signature genes for each cell type / process   |
| <code>expression_values</code> | expression values to use                                 |
| <code>reverse_log_scale</code> | reverse expression values from log scale                 |
| <code>logbase</code>           | log base to use if <code>reverse_log_scale = TRUE</code> |
| <code>output_enrichment</code> | how to return enrichment output                          |
| <code>name</code>              | to give to spatial enrichment results, default = PAGE    |
| <code>return_gobject</code>    | return giotto object                                     |

**Details**

For details see the individual functions:

- PAGE: [PAGEEnrich](#)
- PAGE: [rankEnrich](#)
- PAGE: [hyperGeometricEnrich](#)

**Value**

Giotto object or enrichment results if return\_gobject = FALSE

**Examples**

```
createSpatialEnrich(gobject)
```

---

|                   |                          |
|-------------------|--------------------------|
| createSpatialGrid | <i>createSpatialGrid</i> |
|-------------------|--------------------------|

---

**Description**

Create a spatial grid.

**Usage**

```
createSpatialGrid(
  gobject,
  sdimx_stepsize = NULL,
  sdimy_stepsize = NULL,
  sdimz_stepsize = NULL,
  minimum_padding = 1,
  name = "spatial_grid",
  return_gobject = TRUE
)
```

**Arguments**

|                 |  |
|-----------------|--|
| gobject         | giotto object                                    |
| sdimx_stepsize  | stepsize along the x-axis                        |
| sdimy_stepsize  | stepsize along the y-axis                        |
| sdimz_stepsize  | stepsize along the z-axis                        |
| minimum_padding | minimum padding on the edges                     |
| name            | name for spatial grid (default = 'spatial_grid') |
| return_gobject  | boolean: return giotto object (default = TRUE)   |

**Details**

Creates a spatial grid with defined x, y (and z) dimensions. The dimension units are based on the provided spatial location units.

**Value**

giotto object with updated spatial grid slot

**Examples**

```
createSpatialGrid(gobject)
```

---

createSpatialGrid\_2D    *createSpatialGrid\_2D*

---

## Description

create a spatial grid for 2D spatial data.

## Usage

```
createSpatialGrid_2D(  
  gobject,  
  sdimx_stepsize = NULL,  
  sdimy_stepsize = NULL,  
  minimum_padding = 1,  
  name = "spatial_grid",  
  return_gobject = TRUE  
)
```

## Arguments

|                              |  |
|------------------------------|--|
| <code>gobject</code>         | giotto object                                    |
| <code>sdimx_stepsize</code>  | stepsize along the x-axis                        |
| <code>sdimy_stepsize</code>  | stepsize along the y-axis                        |
| <code>minimum_padding</code> | minimum padding on the edges                     |
| <code>name</code>            | name for spatial grid (default = 'spatial_grid') |
| <code>return_gobject</code>  | boolean: return giotto object (default = TRUE)   |

## Details

Creates a spatial grid with defined x, y (and z) dimensions. The dimension units are based on the provided spatial location units.

## Value

giotto object with updated spatial grid slot

## Examples

```
createSpatialGrid_2D(gobject)
```

---

```
createSpatialGrid_3D    createSpatialGrid_3D
```

---

## Description

Create a spatial grid for 3D spatial data.

## Usage

```
createSpatialGrid_3D(
  gobject,
  sdimx_stepsize = NULL,
  sdimy_stepsize = NULL,
  sdimz_stepsize = NULL,
  minimum_padding = 1,
  name = "spatial_grid",
  return_gobject = TRUE
)
```

## Arguments

|                              |  |
|------------------------------|--|
| <code>gobject</code>         | giotto object                                    |
| <code>sdimx_stepsize</code>  | stepsize along the x-axis                        |
| <code>sdimy_stepsize</code>  | stepsize along the y-axis                        |
| <code>sdimz_stepsize</code>  | stepsize along the z-axis                        |
| <code>minimum_padding</code> | minimum padding on the edges                     |
| <code>name</code>            | name for spatial grid (default = 'spatial_grid') |
| <code>return_gobject</code>  | boolean: return giotto object (default = TRUE)   |

## Details

Creates a spatial grid with defined x, y (and z) dimensions. The dimension units are based on the provided spatial location units.

## Value

giotto object with updated spatial grid slot

## Examples

```
createSpatialGrid_3D(gobject)
```

---

```
createSpatialNetwork    createSpatialNetwork
```

---

## Description

Create a spatial network based on cell centroid physical distances.

## Usage

```
createSpatialNetwork(
  gobject,
  k = 4,
  dimensions = "all",
  maximum_distance = NULL,
  minimum_k = 0,
  name = "spatial_network",
  verbose = F,
  return_gobject = TRUE
)
```

## Arguments

|                               |   |
|-------------------------------|---|
| <code>gobject</code>          | giotto object   |
| <code>k</code>                | number of nearest neighbors based on physical distance              |
| <code>dimensions</code>       | which spatial dimensions to use (default = all)                     |
| <code>maximum_distance</code> | distance cutoff for nearest neighbors to consider                   |
| <code>minimum_k</code>        | minimum nearest neighbours if <code>maximum_distance</code> != NULL |
| <code>name</code>             | name for spatial network (default = 'spatial_network')              |
| <code>verbose</code>          | verbose   |
| <code>return_gobject</code>   | boolean: return giotto object (default = TRUE)                      |

## Details

Creates a spatial network connecting single-cells based on their physical distance to each other. Number of neighbors can be determined by `k`, maximum distance from each cell with or without setting a minimum `k` for each cell.

**dimensions:** default = 'all' which takes all possible dimensions. Alternatively you can provide a character vector that specifies the spatial dimensions to use, e.g. `c("sdimx", "sdimy")` or a numerical vector, e.g. `2:3`

**maximum\_distance:** to create a network based on maximum distance only, you also need to set `k` to a very high value, e.g. `k = 100`

## Value

giotto object with updated spatial network slot

## Examples

```
createSpatialNetwork(gobject)
```

---

```
create_average_detection_DT
      create_average_detection_DT
```

---

**Description**

calculates average gene detection for a cell metadata factor (e.g. cluster)

**Usage**

```
create_average_detection_DT(
  gobject,
  meta_data_name,
  expression_values = c("normalized", "scaled", "custom"),
  detection_threshold = 0
)
```

**Arguments**

```
gobject          giotto object
meta_data_name   name of metadata column to use
expression_values
                  which expression values to use
detection_threshold
                  detection threshold to consider a gene detected
```

**Value**

data.table with average gene expression values for each factor

---

```
create_average_DT      create_average_DT
```

---

**Description**

calculates average gene expression for a cell metadata factor (e.g. cluster)

**Usage**

```
create_average_DT(
  gobject,
  meta_data_name,
  expression_values = c("normalized", "scaled", "custom")
)
```

**Arguments**

```
gobject          giotto object
meta_data_name   name of metadata column to use
expression_values
                  which expression values to use
```

**Value**

data.table with average gene expression values for each factor

---

```
create_cell_type_random_cell_IDs  
  create_cell_type_random_cell_IDs
```

---

**Description**

creates randomized cell ids within a selection of cell types

**Usage**

```
create_cell_type_random_cell_IDs(  
  gobject,  
  cluster_column = "cell_types",  
  needed_cell_types  
)
```

**Arguments**

`gobject`                giotto object to use

`cluster_column`   cluster column with cell type information

`needed_cell_types`  
                      vector of cell type names for which a random id will be found

**Details**

Details will follow.

**Value**

list of randomly sampled cell ids with same cell type composition

**Examples**

```
create_cell_type_random_cell_IDs(gobject)
```

---

create\_cluster\_matrix    *create\_cluster\_matrix*

---

### Description

creates aggregated matrix for a given clustering

### Usage

```
create_cluster_matrix(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  gene_subset = NULL
)
```

### Examples

```
create_cluster_matrix(gobject)
```

---

create\_dimObject            *create\_dimObject*

---

### Description

Creates an object that stores a dimension reduction output

### Usage

```
create_dimObject(
  name = "test",
  reduction_method = NULL,
  coordinates = NULL,
  misc = NULL,
  my_rownames = NULL
)
```

### Arguments

|                  |   |
|------------------|---|
| name             | arbitrary name for object                             |
| reduction_method | method used to reduce dimensions                      |
| coordinates      | accepts the coordinates after dimension reduction     |
| misc             | any additional information will be added to this slot |

### Value

number of distinct colors

---

|                      |                             |
|----------------------|-----------------------------|
| decide_cluster_order | <i>decide_cluster_order</i> |
|----------------------|-----------------------------|

---

## Description

creates order for clusters

## Usage

```
decide_cluster_order(  
  gobject,  
  expression_values = c("normalized", "scaled", "custom"),  
  genes,  
  cluster_column = NULL,  
  cluster_order = c("size", "correlation", "custom"),  
  cluster_custom_order = NULL,  
  cor_method = "pearson",  
  hclust_method = "ward.D"  
)
```

## Arguments

|                      |                                    |
|----------------------|------------------------------------|
| gobject              | giotto object                      |
| expression_values    | expression values to use           |
| genes                | genes to use                       |
| cluster_column       | name of column to use for clusters |
| cluster_order        | method to determine cluster order  |
| cluster_custom_order | custom order for clusters          |
| cor_method           | method for correlation             |
| hclust_method        | method for hierarchical clustering |

## Details

Calculates order for clusters.

## Value

custom

## Examples

```
decide_cluster_order(gobject)
```

---

detectSpatialCorGenes    *detectSpatialCorGenes*

---

## Description

Detect genes that are spatially correlated

## Usage

```
detectSpatialCorGenes(
  gobject,
  method = c("grid", "network"),
  expression_values = c("normalized", "scaled", "custom"),
  subset_genes = NULL,
  spatial_network_name = "spatial_network",
  network_smoothing = NULL,
  spatial_grid_name = "spatial_grid",
  min_cells_per_grid = 4,
  cor_method = c("pearson", "kendall", "spearman")
)
```

## Arguments

|                      |   |
|----------------------|---|
| gobject              | giotto object   |
| method               | method to use for spatial averaging                   |
| expression_values    | gene expression values to use                         |
| subset_genes         | subset of genes to use                                |
| spatial_network_name | name of spatial network to use                        |
| network_smoothing    | smoothing factor between 0 and 1 (default: automatic) |
| spatial_grid_name    | name of spatial grid to use                           |
| min_cells_per_grid   | minimum number of cells to consider a grid            |
| b                    | smoothing factor between 0 and 1 (default: automatic) |

## Details

For method = network, it expects a fully connected spatial network. You can make sure to create a fully connected network by setting `minimal_k > 0` in the [createSpatialNetwork](#) function.

- 1. grid-averaging: average gene expression values within a predefined spatial grid
- 2. network-averaging: smoothens the gene expression matrix by averaging the expression within one cell by using the neighbours within the predefined spatial network. `b` is a smoothening factor that defaults to  $1 - 1/k$ , where `k` is the median number of `k`-neighbors in the selected spatial network. Setting `b = 0` means no smoothing and `b = 1` means no contribution from its own expression.

The `spatCorObject` can be further explored with `showSpatialCorGenes()`

**Value**

returns a spatial correlation object: "spatCorObject"

**See Also**

[showSpatialCorGenes](#)

**Examples**

```
detectSpatialCorGenes(gobject)
```

---

detectSpatialPatterns    *detectSpatialPatterns*

---

**Description**

Identify spatial patterns through PCA on average expression in a spatial grid.

**Usage**

```
detectSpatialPatterns(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  spatial_grid_name = "spatial_grid",
  min_cells_per_grid = 4,
  scale_unit = F,
  ncp = 100,
  show_plot = T,
  PC_zscore = 1.5
)
```

**Arguments**

|                                 |  |
|---------------------------------|--|
| <code>gobject</code>            | giotto object  |
| <code>expression_values</code>  | expression values to use                               |
| <code>spatial_grid_name</code>  | name of spatial grid to use (default = 'spatial_grid') |
| <code>min_cells_per_grid</code> | minimum number of cells in a grid to be considered     |
| <code>scale_unit</code>         | scale features   |
| <code>ncp</code>                | number of principal components to calculate            |
| <code>show_plot</code>          | show plots   |
| <code>PC_zscore</code>          | minimum z-score of variance explained by a PC          |

## Details

Steps to identify spatial patterns:

- 1. average gene expression for cells within a grid, see createSpatialGrid
- 2. perform PCA on the average grid expression profiles
- 3. convert variance of principal components (PCs) to z-scores and select PCs based on a z-score threshold

## Value

spatial pattern object 'spatPatObj'

## Examples

```
detectSpatialPatterns(gobject)
```

---

|             |                    |
|-------------|--------------------|
| dimCellPlot | <i>dimCellPlot</i> |
|-------------|--------------------|

---

## Description

Visualize cells according to dimension reduction coordinates

## Usage

```
dimCellPlot(
  gobject,
  dim_reduction_to_use = "umap",
  dim_reduction_name = "umap",
  dim1_to_use = 1,
  dim2_to_use = 2,
  spat_enr_names = NULL,
  cell_annotation_values,
  show_NN_network = F,
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  cell_color_gradient = c("blue", "white", "red"),
  gradient_midpoint = NULL,
  gradient_limits = NULL,
  select_cell_groups = NULL,
  select_cells = NULL,
  show_other_cells = T,
  other_cell_color = "lightgrey",
  other_point_size = 0.5,
  show_cluster_center = F,
  show_center_label = T,
  center_point_size = 4,

  center_point_border_stroke = 0.1,
  label_size = 4,
  label_fontface = "bold",
```

```

    edge_alpha = NULL,
    point_size = 1,
    point_border_col = "black",
    point_border_stroke = 0.1,
    show_legend = T,
    legend_text = 8,
    axis_text = 8,
    axis_title = 8,
    cow_n_col = 2,
    cow_rel_h = 1,
    cow_rel_w = 1,
    cow_align = "h",
    show_plot = NA,
    return_plot = NA,
    save_plot = NA,
    save_param = list(),
    default_save_name = "dimCellPlot"
)

```

### Arguments

|                                     |  |
|-------------------------------------|--|
| <code>gobject</code>                | giotto object  |
| <code>dim_reduction_to_use</code>   | dimension reduction to use   |
| <code>dim_reduction_name</code>     | dimension reduction name   |
| <code>dim1_to_use</code>            | dimension to use on x-axis   |
| <code>dim2_to_use</code>            | dimension to use on y-axis   |
| <code>spat_enr_names</code>         | names of spatial enrichment results to include                             |
| <code>cell_annotation_values</code> | numeric cell annotation columns  |
| <code>show_NN_network</code>        | show underlying NN network   |
| <code>nn_network_to_use</code>      | type of NN network to use (kNN vs sNN)                                     |
| <code>network_name</code>           | name of NN network to use, if <code>show_NN_network = TRUE</code>          |
| <code>cell_color_gradient</code>    | vector with 3 colors for numeric data                                      |
| <code>gradient_midpoint</code>      | midpoint for color gradient  |
| <code>gradient_limits</code>        | vector with lower and upper limits   |
| <code>select_cell_groups</code>     | select subset of cells/clusters based on <code>cell_color</code> parameter |
| <code>select_cells</code>           | select subset of cells based on cell IDs                                   |
| <code>show_other_cells</code>       | display not selected cells   |
| <code>other_cell_color</code>       | color of not selected cells  |

|                     |  |
|---------------------|--|
| other_point_size    | size of not selected cells   |
| show_cluster_center | plot center of selected clusters   |
| show_center_label   | plot label of selected clusters  |
| center_point_size   | size of center points  |
| label_size          | size of labels   |
| label_fontface      | font of labels   |
| edge_alpha          | column to use for alpha of the edges                                       |
| point_size          | size of point (cell)   |
| point_border_col    | color of border around points  |
| point_border_stroke | stroke size of border around points  |
| show_legend         | show legend  |
| legend_text         | size of legend text  |
| axis_text           | size of axis text  |
| axis_title          | size of axis title   |
| show_plot           | show plot  |
| return_plot         | return ggplot object   |
| save_plot           | directly save the plot [boolean]   |
| save_param          | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name   | default save name for saving, don't change, change save_name in save_param |
| cell_color          | color for cells (see details)  |
| color_as_factor     | convert color column to factor   |
| cell_color_code     | named vector with colors   |
| title               | title for plot, defaults to cell_color parameter                           |

## Details

Description of parameters. For 3D plots see [dimCellPlot2D](#)

## Value

ggplot

## Examples

```
dimCellPlot(gobject)
```

---

dimCellPlot2D

dimCellPlot2D

---

## Description

Visualize cells according to dimension reduction coordinates

## Usage

```
dimCellPlot2D(
  gobject,
  dim_reduction_to_use = "umap",
  dim_reduction_name = "umap",
  dim1_to_use = 1,
  dim2_to_use = 2,
  spat_enr_names = NULL,
  cell_annotation_values,
  show_NN_network = F,
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  cell_color_gradient = c("blue", "white", "red"),
  gradient_midpoint = NULL,
  gradient_limits = NULL,
  select_cell_groups = NULL,
  select_cells = NULL,
  show_other_cells = T,
  other_cell_color = "lightgrey",
  other_point_size = 0.5,
  show_cluster_center = F,
  show_center_label = T,
  center_point_size = 4,
  center_point_border_col = "black",
  center_point_border_stroke = 0.1,
  label_size = 4,
  label_fontface = "bold",
  edge_alpha = NULL,
  point_size = 1,
  point_border_col = "black",
  point_border_stroke = 0.1,
  show_legend = T,
  legend_text = 8,
  axis_text = 8,
  axis_title = 8,
  cow_n_col = 2,
  cow_rel_h = 1,
  cow_rel_w = 1,
  cow_align = "h",
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
```

```

    default_save_name = "dimCellPlot2D"
)

```

### Arguments

```

gobject          giotto object
dim_reduction_to_use
                  dimension reduction to use
dim_reduction_name
                  dimension reduction name
dim1_to_use      dimension to use on x-axis
dim2_to_use      dimension to use on y-axis
spat_enr_names   names of spatial enrichment results to include
cell_annotation_values
                  numeric cell annotation columns
show_NN_network
                  show underlying NN network
nn_network_to_use
                  type of NN network to use (kNN vs sNN)
network_name     name of NN network to use, if show_NN_network = TRUE
cell_color_gradient
                  vector with 3 colors for numeric data
gradient_midpoint
                  midpoint for color gradient
gradient_limits
                  vector with lower and upper limits
select_cell_groups
                  select subset of cells/clusters based on cell_color parameter
select_cells     select subset of cells based on cell IDs
show_other_cells
                  display not selected cells
other_cell_color
                  color of not selected cells
other_point_size
                  size of not selected cells
show_cluster_center
                  plot center of selected clusters
show_center_label
                  plot label of selected clusters
center_point_size
                  size of center points
label_size       size of labels
label_fontface   font of labels
edge_alpha       column to use for alpha of the edges
point_size       size of point (cell)
point_border_col
                  color of border around points

```

|                     |  |
|---------------------|--|
| point_border_stroke | stroke size of border around points  |
| show_legend         | show legend  |
| legend_text         | size of legend text  |
| axis_text           | size of axis text  |
| axis_title          | size of axis title   |
| show_plot           | show plot  |
| return_plot         | return ggplot object   |
| save_plot           | directly save the plot [boolean]   |
| save_param          | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name   | default save name for saving, don't change, change save_name in save_param |
| cell_color          | color for cells (see details)  |
| color_as_factor     | convert color column to factor   |

| <code>show_center_label</code>   | plot label of selected clusters  |
| <code>center_point_size</code>   | size of center points  |
| <code>label_size</code>          | size of labels   |
| <code>label_fontface</code>      | font of labels   |
| <code>edge_alpha</code>          | column to use for alpha of the edges   |
| <code>point_shape</code>         | point with border or not (border or no_border)   |
| <code>point_size</code>          | size of point (cell)   |
| <code>point_border_col</code>    | color of border around points  |
| <code>point_border_stroke</code> | stroke size of border around points  |
| <code>title</code>               | title for plot, defaults to <code>cell_color</code> parameter  |
| <code>show_legend</code>         | show legend  |
| <code>legend_text</code>         | size of legend text  |
| <code>axis_text</code>           | size of axis text  |
| <code>axis_title</code>          | size of axis title   |
| <code>cow_n_col</code>           | cowplot param: how many columns  |
| <code>cow_rel_h</code>           | cowplot param: relative height   |
| <code>cow_rel_w</code>           | cowplot param: relative width  |
| <code>cow_align</code>           | cowplot param: how to align  |
| <code>show_plot</code>           | show plot  |
| <code>return_plot</code>         | return ggplot object   |
| <code>save_plot</code>           | directly save the plot [boolean]   |
| <code>save_param</code>          | list of saving parameters from <a href="#">all_plots_save_function</a>                               |
| <code>default_save_name</code>   | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>groub_by</code>            | create multiple plots based on cell annotation column  |

## Details

Description of parameters. For 3D plots see [dimPlot3D](#)

## Value

ggplot

## Examples

```
dimPlot2D(gobject)
```

---

|                  |                         |
|------------------|-------------------------|
| dimPlot2D_single | <i>dimPlot2D_single</i> |
|------------------|-------------------------|

---

## Description

Visualize cells according to dimension reduction coordinates

## Usage

```
dimPlot2D_single(
  gobject,
  dim_reduction_to_use = "umap",
  dim_reduction_name = "umap",
  dim1_to_use = 1,
  dim2_to_use = 2,

### Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>dim_reduction_to_use</code> | dimension reduction to use   |
| <code>dim_reduction_name</code>   | dimension reduction name   |
| <code>dim1_to_use</code>          | dimension to use on x-axis   |
| <code>dim2_to_use</code>          | dimension to use on y-axis   |
| <code>spat_enr_names</code>       | names of spatial enrichment results to include                             |
| <code>show_NN_network</code>      | show underlying NN network   |
| <code>nn_network_to_use</code>    | type of NN network to use (kNN vs sNN)                                     |
| <code>network_name</code>         | name of NN network to use, if <code>show_NN_network = TRUE</code>          |
| <code>cell_color</code>           | color for cells (see details)  |
| <code>color_as_factor</code>      | convert color column to factor   |
| <code>cell_color_code</code>      | named vector with colors   |
| <code>cell_color_gradient</code>  | vector with 3 colors for numeric data                                      |
| <code>gradient_midpoint</code>    | midpoint for color gradient  |
| <code>gradient_limits</code>      | vector with lower and upper limits   |
| <code>select_cell_groups</code>   | select subset of cells/clusters based on <code>cell_color</code> parameter |
| <code>select_cells</code>         | select subset of cells based on cell IDs                                   |
| <code>show_other_cells</code>     | display not selected cells   |
| <code>other_cell_color</code>     | color of not selected cells  |
| <code>other_point_size</code>     | size of not selected cells   |
| <code>show_cluster_center</code>  | plot center of selected clusters   |
| <code>show_center_label</code>    | plot label of selected clusters  |
| <code>center_point_size</code>    | size of center points  |
| <code>label_size</code>           | size of labels   |
| <code>label_fontface</code>       | font of labels   |
| <code>edge_alpha</code>           | column to use for alpha of the edges                                       |

|                     |  |
|---------------------|--|
| point_shape         | point with border or not (border or no_border)                             |

  dimensions_to_use = 1:10,
  name = "test",
  k = 10,
  betas = c(0, 2, 50),
  tolerance = 1e-10,
  zscore = c("none", "rowcol", "colrow"),
  numinit = 100,
  python_path = NULL,
  output_folder = NULL,
  overwrite_output = TRUE
)
```

**Arguments**

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object                           |
| <code>expression_values</code>    | expression values to use                |
| <code>spatial_network_name</code> | name of spatial network to use for HMRF |

spatial\_genes    spatial genes to use for HMRF  
spatial\_dimensions    select spatial dimensions to use, default is all possible dimensions  
dim\_reduction\_to\_use    use another dimension reduction set as input  
dim\_reduction\_name    name of dimension reduction set to use  
dimensions\_to\_use    number of dimensions to use as input  
name    name of HMRF run  
k    number of HMRF domains  
betas    betas to test for  
tolerance    tolerance  
zscore    zscore  
numinit    number of initializations  
python\_path    python path to use  
output\_folder    output folder to save results  
overwrite\_output    overwrite output folder

doKmeans(gobject)
```

doLeidenCluster

*doLeidenCluster***Description**

cluster cells using a NN-network and the Leiden community detection algorithm

**Usage**

```
doLeidenCluster(
  gobject,
  name = "leiden_clus",
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  python_path = NULL,
  resolution = 1,
  weight_col = "weight",
  partition_type = c("RBConfigurationVertexPartition", "ModularityVertexPartition"),
  init_membership = NULL,
  n_iterations = 1000,
  return_gobject = TRUE,
  set_seed = T,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object  |
| <code>name</code>              | name for cluster   |
| <code>nn_network_to_use</code> | type of NN network to use (kNN vs sNN)   |
| <code>network_name</code>      | name of NN network to use  |
| <code>python_path</code>       | specify specific path to python if required  |
| <code>resolution</code>        | resolution   |
| <code>weight_col</code>        | weight column to use for edges   |
| <code>partition_type</code>    | The type of partition to use for optimisation.   |
| <code>init_membership</code>   | initial membership of cells for the partition  |
| <code>n_iterations</code>      | number of iterations to run the Leiden algorithm. If the number of iterations is negative, the Leiden algorithm is run until an iteration in which there was no improvement. |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE)   |
| <code>set_seed</code>          | set seed   |
| <code>seed_number</code>       | number for seed  |

## Details

This function is a wrapper for the Leiden algorithm implemented in python, which can detect communities in graphs of millions of nodes (cells), as long as they can fit in memory. See the <https://github.com/vtraag/leidenalg> github page or the <https://leidenalg.readthedocs.io/en/stable/index.html> readthedocs page for more information.

Partition types available and information:

- **RBConfigurationVertexPartition**: Implements Reichardt and Bornholdt's Potts model with a configuration null model. This quality function is well-defined only for positive edge weights. This quality function uses a linear resolution parameter.
- **ModularityVertexPartition**: Implements modularity. This quality function is well-defined only for positive edge weights. It does *not* use the resolution parameter

Set `weight_col = NULL` to give equal weight (=1) to each edge.

## Value

giotto object with new clusters appended to cell metadata

## Examples

```
doLeidenCluster(gobject)
```

---

|                    |                           |

| doLeidenSubCluster | <i>doLeidenSubCluster</i> |
|--------------------|---------------------------|

---

## Description

Further subcluster cells using a NN-network and the Leiden algorithm

## Usage

```
doLeidenSubCluster(
  gobject,
  name = "sub_pleiden_clus",
  cluster_column = NULL,
  selected_clusters = NULL,
  hvg_param = list(reverse_log_scale = T, difference_in_variance = 1, expression_values
    = "normalized"),
  hvg_min_perc_cells = 5,
  hvg_mean_expr_det = 1,
  use_all_genes_as_hvg = FALSE,
  min_nr_of_hvg = 5,
  pca_param = list(expression_values = "normalized", scale_unit = T),
  nn_param = list(dimensions_to_use = 1:20),
  k_neighbors = 10,
  resolution = 0.5,
  n_iterations = 500,
  python_path = NULL,
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
```

```

    return_gobject = TRUE,
    verbose = T
)
```

### Arguments

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object   |
| <code>name</code>                 | name for new clustering result                                    |
| <code>cluster_column</code>       | cluster column to subcluster                                      |
| <code>selected_clusters</code>    | only do subclustering on these clusters                           |
| <code>hvg_param</code>            | parameters for calculateHVG                                       |
| <code>hvg_min_perc_cells</code>   | threshold for detection in min percentage of cells                |
| <code>hvg_mean_expr_det</code>    | threshold for mean expression level in cells with detection       |
| <code>use_all_genes_as_hvg</code> | forces all genes to be HVG and to be used as input for PCA        |
| <code>min_nr_of_hvg</code>        | minimum number of HVG, or all genes will be used as input for PCA |
| <code>pca_param</code>            | parameters for runPCA   |
| <code>nn_param</code>             | parameters for parameters for createNearestNetwork                |
| <code>k_neighbors</code>          | number of k for createNearestNetwork                              |
| <code>resolution</code>           | resolution of Leiden clustering                                   |
| <code>n_iterations</code>         | number of iterations to run the Leiden algorithm.                 |
| <code>python_path</code>          | specify specific path to python if required                       |
| <code>nn_network_to_use</code>    | type of NN network to use (kNN vs sNN)                            |
| <code>network_name</code>         | name of NN network to use   |
| <code>return_gobject</code>       | boolean: return giotto object (default = TRUE)                    |
| <code>verbose</code>              | verbose   |

### Details

This function performs subclustering using the Leiden algorithm on selected clusters. The systematic steps are:

- 1. subset Giotto object
- 2. identify highly variable genes
- 3. run PCA
- 4. create nearest neighbouring network
- 5. do Leiden clustering

### Value

giotto object with new subclusters appended to cell metadata

**See Also**[doLeidenCluster](#)**Examples**

```
doLeidenSubCluster(gobject)
```

doLouvainCluster

*doLouvainCluster***Description**

cluster cells using a NN-network and the Louvain algorithm.

**Usage**

```
doLouvainCluster(
  gobject,
  version = c("community", "multinet"),
  name = "louvain_clus",
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  python_path = NULL,
  resolution = 1,
  weight_col = NULL,
  gamma = 1,
  omega = 1,
  louv_random = F,
  return_gobject = TRUE,
  set_seed = F,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                   |   |
|-------------------|---|
| gobject           | giotto object   |
| version           | implemented version of Louvain clustering to use                                  |
| name              | name for cluster  |
| nn_network_to_use | type of NN network to use (kNN vs sNN)  |
| network_name      | name of NN network to use   |
| python_path       | [community] specify specific path to python if required                           |
| resolution        | [community] resolution  |
| gamma             | [multinet] Resolution parameter for modularity in the generalized louvain method. |
| omega             | [multinet] Inter-layer weight parameter in the generalized louvain method.        |
| return_gobject    | boolean: return giotto object (default = TRUE)                                    |
| set_seed          | set seed  |
| seed_number       | number for seed   |

**Details**

Louvain clustering using the community or multinet implementation of the louvain clustering algorithm.

**Value**

giotto object with new clusters appended to cell metadata

**See Also**

**Examples**

```
doLouvainCluster(gobject)
```

---

```
doLouvainCluster_community
doLouvainCluster_community
```

---

**Description**

cluster cells using a NN-network and the Louvain algorithm from the community module in Python

**Usage**

```
doLouvainCluster_community(
    gobject,
    name = "louvain_clus",
    nn_network_to_use = "sNN",
    network_name = "sNN.pca",
    python_path = NULL,
    resolution = 1,
    weight_col = NULL,
    louv_random = F,
    return_gobject = TRUE,
    set_seed = F,
    seed_number = 1234,
    ...
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object                               |
| <code>name</code>              | name for cluster                            |
| <code>nn_network_to_use</code> | type of NN network to use (kNN vs sNN)      |
| <code>network_name</code>      | name of NN network to use                   |
| <code>python_path</code>       | specify specific path to python if required |
| <code>resolution</code>        | resolution                                  |

|                |  |
|----------------|--|
| weight_col     | weight column to use for edges   |
| louv_random    | Will randomize the node evaluation order and the community evaluation order to get different partitions at each call |
| return_gobject | boolean: return giotto object (default = TRUE)   |
| set_seed       | set seed   |
| seed_number    | number for seed  |

### Details

This function is a wrapper for the Louvain algorithm implemented in Python, which can detect communities in graphs of nodes (cells). See the <https://python-louvain.readthedocs.io/en/latest/index.html> readthedocs page for more information.

Set *weight\_col* = *NULL* to give equal weight (=1) to each edge.

### Value

giotto object with new clusters appended to cell metadata

### Examples

```
doLouvainCluster_community(gobject)
```

---

```
doLouvainCluster_multinet
doLouvainCluster_multinet
```

---

### Description

cluster cells using a NN-network and the Louvain algorithm from the multinet package in R.

### Usage

```
doLouvainCluster_multinet(
  gobject,
  name = "louvain_clus",
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  gamma = 1,
  omega = 1,
  return_gobject = TRUE,
  set_seed = F,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object  |
| <code>name</code>              | name for cluster   |
| <code>nn_network_to_use</code> | type of NN network to use (kNN vs sNN)                                 |
| <code>network_name</code>      | name of NN network to use  |
| <code>gamma</code>             | Resolution parameter for modularity in the generalized louvain method. |
| <code>omega</code>             | Inter-layer weight parameter in the generalized louvain method.        |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE)                         |
| <code>set_seed</code>          | set seed   |
| <code>seed_number</code>       | number for seed  |

**Details**

See [glouvain\\_ml](#) from the multinet package in R for more information.

**Value**

giotto object with new clusters appended to cell metadata

**Examples**

```
doLouvainCluster_multinet(gobject)
```

---

|                                  |                            |
|----------------------------------|----------------------------|
| <code>doLouvainSubCluster</code> | <i>doLouvainSubCluster</i> |
|----------------------------------|----------------------------|

---

**Description**

subcluster cells using a NN-network and the Louvain algorithm

**Usage**

```
doLouvainSubCluster(
  gobject,
  name = "sub_louvain_clus",
  version = c("community", "multinet"),
  cluster_column = NULL,
  selected_clusters = NULL,
  hvg_param = list(reverse_log_scale = T, difference_in_variance = 1, expression_values
    = "normalized"),

### Examples

```
doLouvainSubCluster_multinet(gobject)
```

---

doRandomWalkCluster     *doRandomWalkCluster*

---

### Description

Cluster cells using a random walk approach.

**Usage**

```
doRandomWalkCluster(
  gobject,
  name = "random_walk_clus",
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  walk_steps = 4,
  walk_clusters = 10,
  walk_weights = NA,
  return_gobject = TRUE,
  set_seed = F,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object                                  |
| <code>name</code>              | name for cluster                               |
| <code>nn_network_to_use</code> | type of NN network to use (kNN vs sNN)         |
| <code>network_name</code>      | name of NN network to use                      |
| <code>walk_steps</code>        | number of walking steps                        |
| <code>walk_clusters</code>     | number of final clusters                       |
| <code>walk_weights</code>      | cluster column defining the walk weights       |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE) |
| <code>set_seed</code>          | set seed                                       |
| <code>seed_number</code>       | number for seed                                |

**Details**

See [cluster\\_walktrap](#) function from the `igraph` package in R for more information.

**Value**

giotto object with new clusters appended to cell metadata

**Examples**

```
doRandomWalkCluster(gobject)
```

doSNNCluster

*doSNNCluster***Description**

Cluster cells using a SNN cluster approach.

**Usage**

```
doSNNCluster(
  gobject,
  name = "sNN_clus",
  nn_network_to_use = "kNN",
  network_name = "kNN.pca",
  k = 20,
  eps = 4,
  minPts = 16,
  borderPoints = TRUE,
  return_gobject = TRUE,
  set_seed = F,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object   |
| <code>name</code>              | name for cluster  |
| <code>nn_network_to_use</code> | type of NN network to use (only works on kNN)   |
| <code>network_name</code>      | name of kNN network to use  |
| <code>k</code>                 | Neighborhood size for nearest neighbor sparsification to create the shared NN graph.  |
| <code>eps</code>               | Two objects are only reachable from each other if they share at least <code>eps</code> nearest neighbors.                   |
| <code>minPts</code>            | minimum number of points that share at least <code>eps</code> nearest neighbors for a point to be considered a core points. |
| <code>borderPoints</code>      | should borderPoints be assigned to clusters like in DBSCAN?   |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE)  |
| <code>set_seed</code>          | set seed  |
| <code>seed_number</code>       | number for seed   |

**Details**

See [sNNclust](#) from dbscan package

**Value**

giotto object with new clusters appended to cell metadata

**Examples**

```
doSNNCluster(gobject)
```

---

```
do_spatial_grid_averaging  
do_spatial_grid_averaging
```

---

**Description**

smooth gene expression over a defined spatial grid

**Usage**

```
do_spatial_grid_averaging(  
  gobject,  
  expression_values = c("normalized", "scaled", "custom"),  
  subset_genes = NULL,  
  spatial_grid_name = "spatial_grid",  
  min_cells_per_grid = 4  
)
```

**Arguments**

|                                 |  |
|---------------------------------|--|
| <code>gobject</code>            | giotto object                              |
| <code>expression_values</code>  | gene expression values to use              |
| <code>subset_genes</code>       | subset of genes to use                     |
| <code>spatial_grid_name</code>  | name of spatial grid to use                |
| <code>min_cells_per_grid</code> | minimum number of cells to consider a grid |

**Value**

matrix with smoothened gene expression values based on spatial grid

**Examples**

```
do_spatial_grid_averaging(gobject)
```

---

```
do_spatial_knn_smoothing
do_spatial_knn_smoothing
```

---

## Description

smooth gene expression over a kNN spatial network

## Usage

```
do_spatial_knn_smoothing(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  subset_genes = NULL,
  spatial_network_name = "spatial_network",
  b = NULL
)
```

## Arguments

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object   |
| <code>expression_values</code>    | gene expression values to use                         |
| <code>subset_genes</code>         | subset of genes to use                                |
| <code>spatial_network_name</code> | name of spatial network to use                        |
| <code>b</code>                    | smoothing factor between 0 and 1 (default: automatic) |

## Details

This function will smoothen the gene expression values per cell according to its neighbors in the selected spatial network.

`b` is a smoothening factor that defaults to  $1 - 1/k$ , where  $k$  is the median number of  $k$ -neighbors in the selected spatial network. Setting `b = 0` means no smoothing and `b = 1` means no contribution from its own expression.

## Value

matrix with smoothened gene expression values based on kNN spatial network

## Examples

```
do_spatial_knn_smoothing(gobject)
```

---

|              |                     |
|--------------|---------------------|
| dt_to_matrix | <i>dt_to_matrix</i> |
|--------------|---------------------|

---

**Description**

converts data.table to matrix

**Usage**

dt\_to\_matrix(x)

**Examples**

dt\_to\_matrix(x)

---

|                    |                           |
|--------------------|---------------------------|
| exportGiottoViewer | <i>exportGiottoViewer</i> |
|--------------------|---------------------------|

---

**Description**

compute highly variable genes

**Usage**

```
exportGiottoViewer(  
  gobject,  
  output_directory = NULL,  
  spat_enr_names = NULL,  
  factor_annotations,  
  numeric_annotations,  
  dim_reductions,  
  dim_reduction_names,  
  expression_values = c("scaled", "normalized", "custom"),  
  dim_red_rounding = NULL,  
  dim_red_rescale = c(-20, 20),  
  expression_rounding = 2,  
  overwrite_dir = T,  
  verbose = T  
)
```

**Arguments**

- gobject                    giotto object
- output\_directory                    directory where to save the files
- spat\_enr\_names    spatial enrichment results to include for annotations
- factor\_annotations                    giotto cell annotations to view as factor

```

numeric_annotations      giotto cell annotations to view as numeric
dim_reductions           high level dimension reductions to view
dim_reduction_names      specific dimension reduction names
expression_values        expression values to use in Viewer
dim_red_rounding         numerical indicating how to round the coordinates
dim_red_rescale          numerals to rescale the coordinates
expression_rounding      numerical indicating how to round the expression data
overwrite_dir            overwrite files in the directory if it already existed
verbose                 be verbose

```

### Details

Giotto Viewer expects the results from Giotto Analyzer in a specific format, which is provided by this function. To include enrichment results from [createSpatialEnrich](#) include the provided spatial enrichment name (default PAGE or rank) and add the gene signature names (.e.g cell types) to the numeric annotations parameter.

### Value

writes the necessary output to use in Giotto Viewer

### Examples

```
exportGiottoViewer(gobject)
```

---

```

exprOnlyCellCellcommunicationScores
      exprOnlyCellCellcommunicationScores

```

---

### Description

Cell-Cell communication scores based on expression only

### Usage

```

exprOnlyCellCellcommunicationScores(
  gobject,
  cluster_column = "cell_types",
  random_iter = 100,
  gene_set_1,
  gene_set_2,
  log2FC_addendum = 0.1,
  verbose = T
)

```

**Arguments**

|                              |   |
|------------------------------|---|
| <code>gobject</code>         | giotto object to use                      |
| <code>cluster_column</code>  | cluster column with cell type information |
| <code>random_iter</code>     | number of iterations                      |
| <code>gene_set_1</code>      | first specific gene set from gene pairs   |
| <code>gene_set_2</code>      | second specific gene set from gene pairs  |
| <code>log2FC_addendum</code> | addendum to add when calculating log2FC   |
| <code>verbose</code>         | verbose                                   |

**Details**

Statistical framework to identify if pairs of genes (such as ligand-receptor combinations) are expressed at higher levels than expected based on a reshuffled null distribution of gene expression values, without considering the spatial position of cells. More details will follow soon.

**Value**

Cell-Cell communication scores for gene pairs based on expression only

**Examples**

```
exprOnlyCellCellcommunicationScores(gobject)
```

---

|                                |                          |
|--------------------------------|--------------------------|
| <code>extended_gini_fun</code> | <i>extended_gini_fun</i> |
|--------------------------------|--------------------------|

---

**Description**

calculate gini coefficient on a minimum length vector

**Usage**

```
extended_gini_fun(x, weights = rep(1, length = length(x)), minimum_length = 16)
```

**Value**

gini coefficient

---

|                       |                              |
|-----------------------|------------------------------|
| extractNearestNetwork | <i>extractNearestNetwork</i> |
|-----------------------|------------------------------|

---

**Description**

Extracts a NN-network from a Giotto object

**Usage**

```
extractNearestNetwork(  
  gobject,  
  nn_network_to_use = "sNN",  
  network_name = "sNN.pca",  
  output = c("igraph", "data.table")  
)
```

**Arguments**

|                   |                                      |
|-------------------|--------------------------------------|
| gobject           | giotto object                        |
| nn_network_to_use | kNN or sNN                           |
| network_name      | name of NN network to be used        |
| output            | return a igraph or data.table object |

**Value**

igraph or data.table object

**Examples**

```
extractNearestNetwork(gobject)
```

---

|         |                |
|---------|----------------|
| fDataDT | <i>fDataDT</i> |
|---------|----------------|

---

**Description**

show gene metadata

**Usage**

```
fDataDT(gobject)
```

**Arguments**

|         |               |
|---------|---------------|
| gobject | giotto object |
|---------|---------------|

**Value**

data.table with gene metadata

**Examples**

```
pDataDT(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| filterCombinations | <i>filterCombinations</i> |
|--------------------|---------------------------|

---

**Description**

Shows how many genes and cells are lost with combinations of thresholds.

**Usage**

```
filterCombinations(
  gobject,
  expression_values = c("raw", "normalized", "scaled", "custom"),
  expression_thresholds = c(1, 2),
  gene_det_in_min_cells = c(5, 50),
  min_det_genes_per_cell = c(200, 400),
  scale_x_axis = "identity",
  x_axis_offset = 0,
  scale_y_axis = "identity",
  y_axis_offset = 0,
  show_plot = TRUE
)
```

**Arguments**

|                        |  |
|------------------------|--|
| gobject                | giotto object  |
| expression_values      | expression values to use   |
| expression_thresholds  | all thresholds to consider a gene expressed                                      |
| gene_det_in_min_cells  | minimum number of cells that should express a gene to consider that gene further |
| min_det_genes_per_cell | minimum number of expressed genes per cell to consider that cell further         |
| scale_x_axis           | ggplot transformation for x-axis (e.g. log2)                                     |
| x_axis_offset          | x-axis offset to be used together with the scaling transformation                |
| scale_y_axis           | ggplot transformation for y-axis (e.g. log2)                                     |
| y_axis_offset          | y-axis offset to be used together with the scaling transformation                |
| show_plot              | show plot  |

**Details**

Creates a scatterplot that visualizes the number of genes and cells that are lost with a specific combination of a gene and cell threshold given an arbitrary cutoff to call a gene expressed. This function can be used to make an informed decision at the filtering step with filterGiotto.

**Value**

list of data.table and ggplot object

**Examples**

```
filterCombinations(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| filterCPGscores | <i>filterCPGscores</i> |
|-----------------|------------------------|

---

**Description**

visualize Cell Proximity Gene enrichment scores

**Usage**

```
filterCPGscores(
  CPGscore,
  min_cells = 5,
  min_fdr = 0.05,
  min_spat_diff = 0.2,
  min_log2_fc = 0.5,
  keep_int_duplicates = TRUE,
  direction = c("both", "up", "down")
)
```

**Arguments**

|                     |   |
|---------------------|---|
| min_cells           | min number of cells threshold             |
| min_fdr             | false_discovery threshold                 |
| min_spat_diff       | spatial difference threshold              |
| min_log2_fc         | min log2 fold-change                      |
| keep_int_duplicates | keep both cell_A-cell_B and cell_B-cell_A |
| direction           | expression changes to keep                |
| method              | visualization method                      |

**Details**

This function filters the output from `getCellProximityGeneScores` based on false-discovery rate, minimum absolute difference, minimum log fold-change and direction of change.

**Value**

Gene to gene scores in data.table format

**Examples**

```
filterCPGscores(CPGscore)
```

---

|                     |                            |
|---------------------|----------------------------|
| filterDistributions | <i>filterDistributions</i> |
|---------------------|----------------------------|

---

## Description

show gene or cell distribution after filtering on expression threshold

## Usage

```
filterDistributions(
  gobject,
  expression_values = c("raw", "normalized", "scaled", "custom"),
  expression_threshold = 1,
  detection = c("genes", "cells"),
  plot_type = c("histogram", "violin"),
  nr_bins = 30,
  fill_color = "lightblue",
  scale_axis = "identity",
  axis_offset = 0,
  show_plot = TRUE
)
```

## Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>expression_values</code>    | expression values to use                                   |
| <code>expression_threshold</code> | threshold to consider a gene expressed                     |
| <code>detection</code>            | consider genes or cells                                    |
| <code>plot_type</code>            | type of plot   |
| <code>nr_bins</code>              | number of bins for histogram plot                          |
| <code>fill_color</code>           | fill color for plots                                       |
| <code>scale_axis</code>           | ggplot transformation for axis (e.g. log2)                 |
| <code>axis_offset</code>          | offset to be used together with the scaling transformation |
| <code>show_plot</code>            | show plot  |

## Value

ggplot object

## Examples

```
filterDistributions(gobject)
```

---

|              |                     |
|--------------|---------------------|
| filterGiotto | <i>filterGiotto</i> |
|--------------|---------------------|

---

## Description

filter Giotto object based on expression threshold

## Usage

```
filterGiotto(  
  gobject,  
  expression_values = c("raw", "normalized", "scaled", "custom"),  
  expression_threshold = 1,  
  gene_det_in_min_cells = 100,  
  min_det_genes_per_cell = 100,  
  verbose = F  
)
```

## Arguments

|                        |   |
|------------------------|---|
| gobject                | giotto object   |
| expression_values      | expression values to use                              |
| expression_threshold   | threshold to consider a gene expressed                |
| gene_det_in_min_cells  | minimum # of cells that need to express a gene        |
| min_det_genes_per_cell | minimum # of genes that need to be detected in a cell |
| verbose                | verbose   |

## Details

The function [filterCombinations](#) can be used to explore the effect of different parameter values.

## Value

giotto object

## Examples

```
filterGiotto(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| findGiniMarkers | <i>findGiniMarkers</i> |
|-----------------|------------------------|

---

## Description

Identify marker genes for selected clusters based on gini detection and expression scores.

## Usage

```
findGiniMarkers(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  group_1 = NULL,
  group_2 = NULL,
  min_expr_gini_score = 0.5,
  min_det_gini_score = 0.5,
  detection_threshold = 0,
  rank_score = 1
)
```

## Arguments

|                     |   |
|---------------------|---|
| gobject             | giotto object   |
| expression_values   | gene expression values to use                                   |
| cluster_column      | clusters to use   |
| subset_clusters     | selection of clusters to compare                                |
| group_1             | group 1 cluster IDs from cluster_column for pairwise comparison |
| group_2             | group 2 cluster IDs from cluster_column for pairwise comparison |
| min_expr_gini_score | filter on minimum gini coefficient for expression               |
| min_det_gini_score  | filter on minimum gini coefficient for detection                |
| detection_threshold | detection threshold for gene expression                         |
| rank_score          | rank scores to include  |

## Details

Detection of marker genes using the [https://en.wikipedia.org/wiki/Gini\\_coefficient](https://en.wikipedia.org/wiki/Gini_coefficient) gini coefficient is based on the following steps/principles per gene:

- 1. calculate average expression per cluster
- 2. calculate detection fraction per cluster
- 3. calculate gini-coefficient for av. expression values over all clusters

- 4. calculate gini-coefficient for detection fractions over all clusters
- 5. convert gini-scores to rank scores
- 6. for each gene create combined gini score = av. expr gini x detection gini
- 7. for each gene create and sort on combined rank score = expr rank x detection rank

As a results "top gini" genes are genes that are very selectively expressed in a specific cluster, however not always expressed in all cells of that cluster. In other words highly specific, but not necessarily sensitive at the single-cell level.

To perform differential expression between cluster groups you need to specify cluster IDs to the parameters *group\_1* and *group\_2*.

### Value

data.table with marker genes

### Examples

```
findGiniMarkers(gobject)
```

---

```
findGiniMarkers_one_vs_all
      findGiniMarkers_one_vs_all
```

---

### Description

Identify marker genes for all clusters in a one vs all manner based on gini detection and expression scores.

### Usage

```
findGiniMarkers_one_vs_all(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  min_expr_gini_score = 0.5,
  min_det_gini_score = 0.5,
  detection_threshold = 0,
  min_genes = 10,
  verbose = TRUE
)
```

### Arguments

```
gobject      giotto object
expression_values
              gene expression values to use
cluster_column clusters to use
subset_clusters
              selection of clusters to compare
```

min\_expr\_gini\_score      filter on minimum gini coefficient on expression  
 min\_det\_gini\_score      filter on minimum gini coefficient on detection  
 detection\_threshold      detection threshold for gene expression  
 min\_genes      minimum genes to keep per cluster, overrides pval and logFC  
 verbose      be verbose

### Value

data.table with marker genes

### See Also

[findGiniMarkers](#)

### Examples

```
findGiniMarkers_one_vs_all(gobject)
```

---

|             |                    |
|-------------|--------------------|
| findMarkers | <i>findMarkers</i> |
|-------------|--------------------|

---

### Description

Identify marker genes for selected clusters.

### Usage

```

| <code>detection_threshold</code> | gini: detection threshold for gene expression  |
| <code>rank_score</code>          | gini: rank scores to include   |
| <code>group_1_name</code>        | mast: custom name for <code>group_1</code> clusters  |
| <code>group_2_name</code>        | mast: custom name for <code>group_2</code> clusters  |
| <code>adjust_columns</code>      | mast: column in <code>pDataDT</code> to adjust for (e.g. detection rate)   |
| <code>...</code>                 | additional parameters for the <code>findMarkers</code> function in <code>scrn</code> or <code>zlm</code> function in <code>MAST</code> |

**Details**

Wrapper for all individual functions to detect marker genes for clusters.

**Value**

data.table with marker genes

**See Also**

[findScranMarkers](#), [findGiniMarkers](#) and [findMastMarkers](#)

**Examples**

```
findMarkers(gobject)
```

---

```
findMarkers_one_vs_all
      findMarkers_one_vs_all
```

---

## Description

Identify marker genes for all clusters in a one vs all manner.

## Usage

```
findMarkers_one_vs_all(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  method = c("scrn", "gini", "mast"),
  pval = 0.01,
  logFC = 0.5,
  min_genes = 10,
  min_expr_gini_score = 0.5,
  min_det_gini_score = 0.5,
  detection_threshold = 0,
  rank_score = 1,
  adjust_columns = NULL,
  verbose = TRUE,
  ...
)
```

## Arguments

|                                  |   |
|----------------------------------|---|
| <code>gobject</code>             | giotto object   |
| <code>expression_values</code>   | gene expression values to use                               |
| <code>cluster_column</code>      | clusters to use   |
| <code>subset_clusters</code>     | selection of clusters to compare                            |
| <code>method</code>              | method to use to detect differentially expressed genes      |
| <code>pval</code>                | scrn & mast: filter on minimal p-value                      |
| <code>logFC</code>               | scan & mast: filter on logFC                                |
| <code>min_genes</code>           | minimum genes to keep per cluster, overrides pval and logFC |
| <code>min_expr_gini_score</code> | gini: filter on minimum gini coefficient for expression     |
| <code>min_det_gini_score</code>  | gini: filter minimum gini coefficient for detection         |
| <code>detection_threshold</code> | gini: detection threshold for gene expression               |
| <code>rank_score</code>          | gini: rank scores to include                                |
| <code>adjust_columns</code>      | mast: column in pDataDT to adjust for (e.g. detection rate) |

|         |  |
|---------|--|
| verbose | be verbose   |
| ...     | additional parameters for the findMarkers function in scan or zlm function in MAST |

### Details

Wrapper for all one vs all functions to detect marker genes for clusters.

### Value

data.table with marker genes

### See Also

[findScranMarkers\\_one\\_vs\\_all](#), [findGiniMarkers\\_one\\_vs\\_all](#) and [findMastMarkers\\_one\\_vs\\_all](#)

### Examples

```
findMarkers_one_vs_all(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| findMastMarkers | <i>findMastMarkers</i> |
|-----------------|------------------------|

---

### Description

Identify marker genes for selected clusters based on the MAST package.

### Usage

```
findMastMarkers(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  group_1 = NULL,
  group_1_name = NULL,
  group_2 = NULL,
  group_2_name = NULL,
  adjust_columns = NULL,
  ...
)
```

### Arguments

|                   |   |
|-------------------|---|
| gobject           | giotto object   |
| expression_values | gene expression values to use                                   |
| cluster_column    | clusters to use   |
| group_1           | group 1 cluster IDs from cluster_column for pairwise comparison |
| group_1_name      | custom name for group_1 clusters                                |
| group_2           | group 2 cluster IDs from cluster_column for pairwise comparison |

group\_2\_name     custom name for group\_2 clusters  
 adjust\_columns   column in pDataDT to adjust for (e.g. detection rate)  
 ...               additional parameters for the zlm function in MAST

### Details

This is a minimal convenience wrapper around the [zlm](#) from the MAST package to detect differentially expressed genes.

### Value

data.table with marker genes

### Examples

```
findMastMarkers(gobject)
```

---

```
findMastMarkers_one_vs_all
               findMastMarkers_one_vs_all
```

---

### Description

Identify marker genes for all clusters in a one vs all manner based on the MAST package.

### Usage

```
findMastMarkers_one_vs_all(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  adjust_columns = NULL,
  pval = 0.001,
  logFC = 1,
  min_genes = 10,
  verbose = TRUE,
  ...
)
```

### Arguments

gobject                giotto object  
 expression\_values     gene expression values to use  
 cluster\_column       clusters to use  
 subset\_clusters       selection of clusters to compare  
 adjust\_columns       column in pDataDT to adjust for (e.g. detection rate)  
 pval                   filter on minimal p-value

|           |   |
|-----------|---|
| logFC     | filter on logFC   |
| min_genes | minimum genes to keep per cluster, overrides pval and logFC |
| verbose   | be verbose  |
| ...       | additional parameters for the zlm function in MAST          |

**Value**

data.table with marker genes

**See Also**

[findMastMarkers](#)

**Examples**

```
findMastMarkers_one_vs_all(gobject)
```

---

|                  |                         |
|------------------|-------------------------|
| findScranMarkers | <i>findScranMarkers</i> |
|------------------|-------------------------|

---

**Description**

Identify marker genes for all or selected clusters based on scran's implementation of findMarkers.

**Usage**

```
findScranMarkers(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  group_1 = NULL,
  group_2 = NULL,
  ...
)
```

**Arguments**

|                   |   |
|-------------------|---|
| gobject           | giotto object   |
| expression_values | gene expression values to use                                   |
| cluster_column    | clusters to use   |
| subset_clusters   | selection of clusters to compare                                |
| group_1           | group 1 cluster IDs from cluster_column for pairwise comparison |
| group_2           | group 2 cluster IDs from cluster_column for pairwise comparison |
| ...               | additional parameters for the findMarkers function in scran     |

**Details**

This is a minimal convenience wrapper around the [findMarkers](#) function from the `scrn` package.

To perform differential expression between cluster groups you need to specify cluster IDs to the parameters `group_1` and `group_2`.

**Value**

data.table with marker genes

**Examples**

```
findScranMarkers(gobject)
```

---

```
findScranMarkers_one_vs_all
  findScranMarkers_one_vs_all
```

---

**Description**

Identify marker genes for all clusters in a one vs all manner based on `scrn`'s implementation of `findMarkers`.

**Usage**

```
findScranMarkers_one_vs_all(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  subset_clusters = NULL,
  pval = 0.01,
  logFC = 0.5,
  min_genes = 10,
  verbose = TRUE,
  ...
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object   |
| <code>expression_values</code> | gene expression values to use   |
| <code>cluster_column</code>    | clusters to use   |
| <code>subset_clusters</code>   | subset of clusters to use   |
| <code>pval</code>              | filter on minimal p-value   |
| <code>logFC</code>             | filter on logFC   |
| <code>min_genes</code>         | minimum genes to keep per cluster, overrides <code>pval</code> and <code>logFC</code> |
| <code>verbose</code>           | be verbose  |
| <code>...</code>               | additional parameters for the <code>findMarkers</code> function in <code>scrn</code>  |

Value

data.table with marker genes

|          |                 |
|----------|-----------------|
| FSV_show | <i>FSV_show</i> |
|----------|-----------------|

---

**Description**

Visualize spatial variable genes caculated by spatial\_DE

**Usage**

```
FSV_show(  
  results,  
  ms_results = NULL,  
  size = c(4, 2, 1),  
  color = c("blue", "green", "red"),  
  sig_alpha = 0.5,  
  unsig_alpha = 0.5  
)
```

**Arguments**

|             |                                     |
|-------------|-------------------------------------|
| results     | results caculated by spatial_DE     |
| ms_results  | ms_results caculated by spatial_DE  |
| size        | indicate different levels of qval   |
| color       | indicate different SV features      |
| sig_alpha   | transparency of significant genes   |
| unsig_alpha | transparency of insignificant genes |

**Details**

Description of parameters.

**Value**

nothing

**Examples**

```
FSV_show(results)
```

---

|                  |                         |
|------------------|-------------------------|
| GenePattern_show | <i>GenePattern_show</i> |
|------------------|-------------------------|

---

## Description

Visualize genes distribution patterns calculated by spatial\_AEH

## Usage

```
GenePattern_show(
  gobject = NULL,
  AEH_results = NULL,
  sdimx = NULL,
  sdimy = NULL,
  point_size = 3,
  point_alpha = 1,
  low_color = "blue",
  mid_color = "white",
  high_color = "red",
  midpoint = 0
)
```

## Arguments

|                          |  |
|--------------------------|--|
| <code>gobject</code>     | giotto object                            |
| <code>AEH_results</code> | results from spatial_AEH                 |
| <code>sdimx</code>       | x axis of spatial locus                  |
| <code>sdimy</code>       | y axis of spatial locus                  |
| <code>point_size</code>  | size of points to indicate cells         |
| <code>point_alpha</code> | transparency of points to indicate cells |
| <code>low_color</code>   | color to indicate low score level        |
| <code>mid_color</code>   | color to indicate middle score level     |
| <code>high_color</code>  | color to indicate high score level       |
| <code>midpoint</code>    | point to set mid_color                   |

## Details

Description of parameters.

## Value

nothing

## Examples

```
GenePattern_show(gobject,AEH_results)
```

---

general\_save\_function    *general\_save\_function*

---

## Description

Function to automatically save plots to directory of interest

## Usage

```
general_save_function(
  gobject,
  plot_object,
  save_dir = NULL,
  save_folder = NULL,
  save_name = NULL,
  default_save_name = "giotto_plot",
  save_format = c("png", "tiff", "pdf", "svg"),
  show_saved_plot = F,
  base_width = NULL,
  base_height = NULL,
  base_aspect_ratio = NULL,
  units = NULL,
  dpi = NULL,
  ...
)
```

## Arguments

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object                              |
| <code>plot_object</code>       | non-ggplot object to plot                  |
| <code>save_dir</code>          | directory to save to                       |
| <code>save_folder</code>       | folder in <code>save_dir</code> to save to |
| <code>save_name</code>         | name of plot                               |
| <code>save_format</code>       | format (e.g. png, tiff, pdf, ...)          |
| <code>show_saved_plot</code>   | load & display the saved plot              |
| <code>base_width</code>        | width                                      |
| <code>base_height</code>       | height                                     |
| <code>base_aspect_ratio</code> | aspect ratio                               |
| <code>units</code>             | units                                      |
| <code>dpi</code>               | Plot resolution                            |

## Examples

```
general_save_function(gobject)
```

---

|              |                     |
|--------------|---------------------|
| get10Xmatrix | <i>get10Xmatrix</i> |
|--------------|---------------------|

---

**Description**

This function creates an expression matrix from a 10X structured folder

**Usage**

```
get10Xmatrix(path_to_data)
```

**Arguments**

path\_to\_data    path to the 10X folder

**Details**

A typical 10X folder is named raw\_feature\_bc\_matrix or raw\_feature\_bc\_matrix. It has 3 files:

- barcodes
- features.tsv.gz
- matrix.mtx.gz

**Value**

expression matrix from 10X

**Examples**

```
get10Xmatrix(10Xmatrix)
```

---

|                            |                                   |
|----------------------------|-----------------------------------|
| getCellProximityGeneScores | <i>getCellProximityGeneScores</i> |
|----------------------------|-----------------------------------|

---

**Description**

Compute cell-cell interaction enrichment (observed vs expected)

**Usage**

```
getCellProximityGeneScores(
  gobject,
  spatial_network_name = "spatial_network",
  cluster_column = "louvain_clus.1",
  selected_genes = NULL,
  expression_values = c("normalized", "scaled", "custom"),
  do_diff_test = TRUE,
  diff_test = c("t.test", "wilcox"),
  minimum_unique_cells = NA,
```

```

    fold_change_addendum = 0.1,
    in_two_directions = TRUE,
    exclude_selected_cells_from_test = F,
    verbose = T
)

```

### Arguments

|   |   |
|---|---|
| <code>gobject</code>                          | giotto object   |
| <code>spatial_network_name</code>             | name of spatial network to use                                |
| <code>cluster_column</code>                   | name of column to use for clusters                            |
| <code>selected_genes</code>                   | selection of genes to perform calculations for                |
| <code>expression_values</code>                | expression values to use                                      |
| <code>do_diff_test</code>                     | perform differential test                                     |
| <code>diff_test</code>                        | which differential expression test                            |
| <code>minimum_unique_cells</code>             | minimum number of cells needed to proceed                     |
| <code>fold_change_addendum</code>             | constant to add when calculating log2 fold-change             |
| <code>in_two_directions</code>                | shows enrichment in both directions: cell1-cell2, cell2-cell1 |
| <code>exclude_selected_cells_from_test</code> | exclude certain cells from test                               |
| <code>verbose</code>                          | verbose   |

### Details

Function to calculate if genes are differentially expressed in cell types when they interact (according to physical proximity) with other cell types. The results data.table contains the following columns:

- `genes`: All or selected list of tested genes
- `cell_expr_1`: average gene expression in cell type 1 from unified\_int cell-cell interaction
- `cell_expr_2`: average gene expression in cell type 2 from unified\_int cell-cell interaction
- `comb_expr`: combined average gene expression in cell type 1 and 2 from unified\_int cell-cell interaction
- `all_cell_expr_1`: average gene expression for all cells from cell type 1
- `all_cell_expr_2`: average gene expression for all cells from cell type 2
- `all_comb_expr`: combined average gene expression for all cells from cell type 1 and 2
- `pval_1`: p-value from test between interacting cells and all cells from cell type 1
- `pval_2`: p-value from test between interacting cells and all cells from cell type 2
- `cell_type_1`: first cell type of cell-cell interaction
- `cell_type_2`: second cell type of cell-cell interaction
- `interaction`: the cell-cell interaction, based on physical proximity
- `nr_1`: number of cell type 1 in the unified cell-cell interaction
- `nr_2`: number of cell type 2 in the unified cell-cell interaction

- all\_nr\_1: number of all cell type 1 in the whole dataset
- all\_nr\_2: number of all cell type 2 in the whole dataset
- diff\_spat: difference between comb\_expr and all\_comb\_expr
- diff\_spat\_1: difference between cell\_expr\_1 and all\_cell\_expr\_1
- diff\_spat\_2: difference between cell\_expr\_1 and all\_cell\_expr\_1
- log2fc\_spat\_1: fold-change of diff\_spat\_1
- log2fc\_spat\_2: fold-change of diff\_spat\_2
- log2fc\_spat: fold-change of diff\_spat
- type\_int: type of interaction
- unified\_int: interaction with alphabetically sorted cell type 1 and cell type 2
- unif\_int\_rank: 1 or 2
- fdr\_1: fdr from test between interacting cells and all cells from cell type 1
- fdr\_2: fdr from test between interacting cells and all cells from cell type 2

### Value

Cell Proximity Gene scores (CPGscores) in data.table format

### Examples

```
getCellProximityGeneScores(gobject)
```

---

```
getClusterSimilarity    getClusterSimilarity
```

---

### Description

Creates data.table with pairwise correlation scores between each cluster.

### Usage

```
getClusterSimilarity(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  cor = c("pearson", "spearman")
)
```

### Arguments

|                   |   |
|-------------------|---|
| gobject           | giotto object                           |
| expression_values | expression values to use                |
| cluster_column    | name of column to use for clusters      |
| cor               | correlation score to calculate distance |

**Details**

Creates data.table with pairwise correlation scores between each cluster and the group size (# of cells) for each cluster. This information can be used together with mergeClusters to combine very similar or small clusters into bigger clusters.

**Value**

data.table

**Examples**

```
getClusterSimilarity(gobject)
```

---

```
getDendrogramSplits    getDendrogramSplits
```

---

**Description**

Split dendrogram at each node and keep the leave (label) information..

**Usage**

```
getDendrogramSplits(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  cor = c("pearson", "spearman"),
  distance = "ward.D",
  h = NULL,
  h_color = "red",
  show_dend = TRUE,
  verbose = TRUE
)
```

**Arguments**

|                   |  |
|-------------------|--|
| gobject           | giotto object                                      |
| expression_values | expression values to use                           |
| cluster_column    | name of column to use for clusters                 |
| cor               | correlation score to calculate distance            |
| distance          | distance method to use for hierarchical clustering |
| h                 | height of horizontal lines to plot                 |
| h_color           | color of horizontal lines                          |
| show_dend         | show dendrogram                                    |
| verbose           | be verbose   |

**Details**

Creates a data.table with three columns and each row represents a node in the dendrogram. For each node the height of the node is given together with the two subdendrograms. This information can be used to determine in a hierarchical manner differentially expressed marker genes at each node.

**Value**

data.table object

**Examples**

```
getDendrogramSplits(gobject)
```

---

|                                |                          |
|--------------------------------|--------------------------|
| <code>getDistinctColors</code> | <i>getDistinctColors</i> |
|--------------------------------|--------------------------|

---

**Description**

Returns a number of distinct colors based on the RGB scale

**Usage**

```
getDistinctColors(n)
```

**Arguments**

n                      number of colors wanted

**Value**

number of distinct colors

---

|                                  |                            |
|----------------------------------|----------------------------|
| <code>getGeneToGeneScores</code> | <i>getGeneToGeneScores</i> |
|----------------------------------|----------------------------|

---

**Description**

Compute gene-gene enrichment scores.

**Usage**

```
getGeneToGeneScores(  
  CPGscore,  
  selected_genes = NULL,  
  specific_genes_1 = NULL,  
  specific_genes_2 = NULL,  
  min_cells = 5,  
  min_fdr = 0.05,  
  min_spat_diff = 0.2,  
  min_log2_fc = 0.5,
```

```

    direction = c("both", "up", "down"),
    fold_change_addendum = 0.1,
    verbose = TRUE
  )

```

### Arguments

|                      |  |
|----------------------|--|
| CPGscore             | CPGscore, output from getCellProximityGeneScores() |
| selected_genes       | select subset of genes                             |
| specific_genes_1     | specific source genes (see details)                |
| specific_genes_2     | specific target genes (see details)                |
| min_cells            | min number of cells threshold                      |
| min_spat_diff        | spatial difference threshold                       |
| min_log2_fc          | log2 fold-change threshold                         |
| direction            | up or downregulation or both                       |
| fold_change_addendum | constant to add when calculating log2 fold-change  |
| verbose              | verbose  |
| min_pval             | p-value threshold                                  |

### Details

This converts the single gene cell proximityscores into pairwise combinations of genes, which allows you to determine if 2 genes are differentially expressed in interacting cell types.

### Value

Gene to gene scores in data.table format

### Examples

```
getGeneToGeneScores(CPGscore)
```

---

```

get_cell_to_cell_sorted_name_conversion
      get_cell_to_cell_sorted_name_conversion

```

---

### Description

creates unified cell-cell interaction names

### Usage

```
get_cell_to_cell_sorted_name_conversion(all_cell_types)
```

### Examples

```
get_cell_to_cell_sorted_name_conversion()
```

---

```
get_interaction_gene_enrichment  
    get_interaction_gene_enrichment
```

---

**Description**

Computes gene enrichment between all interactions

**Usage**

```
get_interaction_gene_enrichment(  
  spatial_network,  
  unified_int_col = "unified_int",  
  source_col = "source_clus",  
  source_IDs = "from",  
  neighb_col = "neighb_clus",  
  neighb_IDs = "to",  
  expression_matrix,  
  cell_annotation,  
  annotation_ID = "uniq_ID",  
  cell_type_col,  
  do_diff_test = T,  
  diff_test = c("t.test", "wilcox"),  
  minimum_unique_cells = NA,  
  exclude_selected_cells_from_test = T,  
  verbose = T  
)
```

**Examples**

```
get_interaction_gene_enrichment()
```

---

```
get_specific_interaction_gene_enrichment  
    get_specific_interaction_gene_enrichment
```

---

**Description**

Computes gene enrichment between specified interaction

**Usage**

```
get_specific_interaction_gene_enrichment(  
  sub_spatial_network,  
  source_col = "source_clus",  
  source_IDs = "from",  
  neighb_col = "neighb_clus",  
  neighb_IDs = "to",  
  expression_matrix,
```

```

interaction_name = "to_specify",
cell_annotation,
annotation_ID = "uniq_ID",
cell_type_col,
do_diff_test = T,
diff_test = c("t.test", "wilcox"),
minimum_unique_cells = NA,
exclude_selected_cells_from_test = T
)

```

### Examples

```
get_specific_interaction_gene_enrichment()
```

---

```
ggplot_save_function  ggplot_save_function
```

---

### Description

Function to automatically save plots to directory of interest

### Usage

```

ggplot_save_function(
  gobject,
  plot_object,
  save_dir = NULL,
  save_folder = NULL,
  save_name = NULL,
  default_save_name = "giotto_plot",
  save_format = NULL,
  show_saved_plot = F,
  ncol = 1,
  nrow = 1,
  scale = 1,
  base_width = NULL,
  base_height = NULL,
  base_aspect_ratio = NULL,
  units = NULL,
  dpi = NULL,
  limitsize = TRUE,
  ...
)

```

### Arguments

|                          |  |
|--------------------------|--|
| <code>gobject</code>     | giotto object                              |
| <code>plot_object</code> | ggplot object to plot                      |
| <code>save_dir</code>    | directory to save to                       |
| <code>save_folder</code> | folder in <code>save_dir</code> to save to |

|                   |  |
|-------------------|--|
| save_name         | name of plot   |
| save_format       | format (e.g. png, tiff, pdf, ...)  |
| show_saved_plot   | load & display the saved plot  |
| ncol              | number of columns  |
| nrow              | number of rows   |
| scale             | scale  |
| base_width        | width  |
| base_height       | height   |
| base_aspect_ratio | aspect ratio   |
| units             | units  |
| dpi               | Plot resolution  |
| limitsize         | When TRUE (the default), ggsave will not save images larger than 50x50 inches, to prevent the common error of specifying dimensions in pixels. |

|--------------|------------------------|
| giotto-class | <i>S4 giotto Class</i> |
|--------------|------------------------|

---

**Description**

Framework of giotto object to store and work with spatial expression data

**Slots**

|                     |   |
|---------------------|---|
| raw_exprs           | raw expression counts                           |
| norm_expr           | normalized expression counts                    |
| norm_scaled_expr    | normalized and scaled expression counts         |
| custom_expr         | custom normalized counts                        |
| spatial_locs        | spatial location coordinates for cells          |
| cell_metadata       | metadata for cells                              |
| gene_metadata       | metadata for genes                              |
| cell_ID             | unique cell IDs                                 |
| gene_ID             | unique gene IDs                                 |
| spatial_network     | spatial network in data.table/data.frame format |
| spatial_grid        | spatial grid in data.table/data.frame format    |
| dimension_reduction | slot to save dimension reduction coordinates    |

nn\_network nearest neighbor network in igraph format  
 parameters slot to save parameters that have been used  
 instructions slot for global function instructions  
 offset\_file offset file used to stitch together image fields  
 OS\_platform Operating System to run Giotto analysis on

---

heatmSpatialCorGenes    *heatmSpatialCorGenes*

---

## Description

Create heatmap of spatially correlated genes

## Usage

```
heatmSpatialCorGenes(
  gobject,
  spatCorObject,
  use_clus_name = NULL,
  show_cluster_annot = TRUE,
  show_row_dend = T,
  show_column_dend = F,
  show_row_names = F,
  show_column_names = F,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "heatmSpatialCorGenes",
  ...
)
```

## Arguments

|                    |   |
|--------------------|---|
| gobject            | giotto object   |
| spatCorObject      | spatial correlation object                                    |
| use_clus_name      | name of clusters to visualize (from clusterSpatialCorGenes()) |
| show_cluster_annot | show cluster annotation on top of heatmap                     |
| show_row_dend      | show row dendrogram   |
| show_column_dend   | show column dendrogram  |
| show_row_names     | show row names  |
| show_column_names  | show column names   |
| show_plot          | show plot   |
| return_plot        | return ggplot object  |

|                   |   |
|-------------------|---|
| save_plot         | directly save the plot [boolean]  |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>            |
| default_save_name | default save name for saving, don't change, change save_name in save_param        |
| ...               | additional parameters to the <a href="#">Heatmap</a> function from ComplexHeatmap |

**Value**

Heatmap generated by ComplexHeatmap

**Examples**

```
heatmSpatialCorGenes(gobject)
```

---

|                      |                             |
|----------------------|-----------------------------|
| hyperGeometricEnrich | <i>hyperGeometricEnrich</i> |
|----------------------|-----------------------------|

---

**Description**

Function to calculate gene signature enrichment scores per spatial position using a hypergeometric test.

**Usage**

```
hyperGeometricEnrich(
  gobject,
  sign_matrix,
  expression_values = c("normalized", "scaled", "custom"),
  reverse_log_scale = TRUE,
  logbase = 2,
  output_enrichment = c("original", "zscore")
)
```

**Arguments**

|                   |  |
|-------------------|--|
| gobject           | Giotto object  |
| sign_matrix       | Matrix of signature genes for each cell type / process |
| expression_values | expression values to use                               |
| reverse_log_scale | reverse expression values from log scale               |
| logbase           | log base to use if reverse_log_scale = TRUE            |
| output_enrichment | how to return enrichment output                        |

**Details**

The enrichment score is calculated based on the p-value from the hypergeometric test,  $-\log_{10}(\text{p-value})$ .

**Value**

data.table with enrichment results

**Examples**

```
hyperGeometricEnrich(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| kmeans_binarize | <i>kmeans_binarize</i> |
|-----------------|------------------------|

---

**Description**

create binarized scores using kmeans

**Usage**

```
kmeans_binarize(x, nstart = 3, iter.max = 10)
```

---

|          |                 |
|----------|-----------------|
| loadHMRF | <i>loadHMRF</i> |
|----------|-----------------|

---

**Description**

load previous HMRF

**Usage**

```
loadHMRF(  
  name_used = "test",  
  output_folder_used,  
  k_used = 10,  
  betas_used,  
  python_path_used  
)
```

**Arguments**

- name\_used            name of HMRF that was run
- output\_folder\_used            output folder that was used
- k\_used            number of HMRF domains that was tested
- betas\_used            betas that were tested
- python\_path\_used            python path that was used

**Details**

Description of HMRF parameters ...

**Value**

reloads a previous ran HMRF from doHRMF

**Examples**

```
loadHMRF(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| makeSignMatrixPAGE | <i>makeSignMatrixPAGE</i> |
|--------------------|---------------------------|

---

**Description**

Function to convert a list of signature genes (e.g. for cell types or processes) into a binary matrix format that can be used with the PAGE enrichment option.

**Usage**

```
makeSignMatrixPAGE(sign_names, sign_list)
```

**Arguments**

|            |  |
|------------|--|
| sign_names | vector with names for each provided gene signature |
| sign_list  | list of genes (signature)                          |

**Value**

matrix

**See Also**

[PAGEEnrich](#)

**Examples**

```
makeSignMatrixPAGE()
```

---

|                    |                           |
|--------------------|---------------------------|
| makeSignMatrixRank | <i>makeSignMatrixRank</i> |
|--------------------|---------------------------|

---

**Description**

Function to convert a single-cell count matrix and a corresponding single-cell cluster vector into a rank matrix that can be used with the Rank enrichment option.

**Usage**

```
makeSignMatrixRank(sc_matrix, sc_cluster_ids, gobject = NULL)
```

**Arguments**

|            |  |
|------------|--|
| sign_names | vector with names for each provided gene signature |
| sign_list  | list of genes (signature)                          |

**Value**

matrix

**See Also**

[rankEnrich](#)

**Examples**

```
makeSignMatrixRank()
```

---

make\_simulated\_network

*make\_simulated\_network*

---

**Description**

Simulate random network.

**Usage**

```
make_simulated_network(  
  gobject,  
  spatial_network_name = "spatial_network",  
  cluster_column,  
  number_of_simulations = 100  
)
```

**Examples**

```
make_simulated_network(gobject)
```

---

mergeClusters

*mergeClusters*

---

**Description**

Merge selected clusters based on pairwise correlation scores and size of cluster.

**Usage**

```
mergeClusters(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  cor = c("pearson", "spearman"),
  new_cluster_name = "merged_cluster",
  min_cor_score = 0.8,
  max_group_size = 20,
  force_min_group_size = 10,
  return_gobject = TRUE,
  verbose = TRUE
)
```

**Arguments**

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>expression_values</code>    | expression values to use   |
| <code>cluster_column</code>       | name of column to use for clusters                                       |
| <code>cor</code>                  | correlation score to calculate distance                                  |
| <code>new_cluster_name</code>     | new name for merged clusters   |
| <code>min_cor_score</code>        | min correlation score to merge pairwise clusters                         |
| <code>max_group_size</code>       | max cluster size that can be merged                                      |
| <code>force_min_group_size</code> | size of clusters that will be merged with their most similar neighbor(s) |
| <code>return_gobject</code>       | return giotto object   |
| <code>verbose</code>              | be verbose   |

**Details**

Merge selected clusters based on pairwise correlation scores and size of cluster. To avoid large clusters to merge the `max_group_size` can be lowered. Small clusters can be forcibly merged with their most similar pairwise cluster by adjusting the `force_min_group_size` parameter. Clusters smaller than this value will be merged independent on the provided `min_cor_score` value. A giotto object is returned by default, if FALSE then the merging vector will be returned.

**Value**

Giotto object

**Examples**

```
mergeClusters(gobject)
```

---

`mygini_fun`*mygini\_fun*

---

**Description**

calculate gini coefficient

**Usage**

```
mygini_fun(x, weights = rep(1, length(x)))
```

**Value**

gini coefficient

---

`nnDT_to_kNN`*nnDT\_to\_kNN*

---

**Description**

Convert a nearest network data.table to a kNN object

**Usage**

```
nnDT_to_kNN(nnDT)
```

**Arguments**

|      |   |
|------|---|
| nnDT | nearest neighbor network in data.table format |
|------|---|

**Value**

kNN object

---

`node_clusters`*node\_clusters*

---

**Description**

Merge selected clusters based on pairwise correlation scores and size of cluster.

**Usage**

```
node_clusters(hclus_obj, verbose = TRUE)
```

**Arguments**

|           |              |
|-----------|--------------|
| hclus_obj | hclus object |
| verbose   | be verbose   |

Value

list of splitted dendrogram nodes from high to low node height

Examples

```
node_clusters(hclus_obj)
```

---

|                 |                        |
|-----------------|------------------------|
| normalizeGiotto | <i>normalizeGiotto</i> |
|-----------------|------------------------|

---

Description

normalize and/or scale expresion values of Giotto object

Usage

```
normalizeGiotto(  
  gobject,  
  norm_methods = c("standard", "osmFISH"),  
  library_size_norm = TRUE,  
  scalefactor = 6000,  
  log_norm = TRUE,  
  logbase = 2,  
  scale_genes = T,  
  scale_cells = T,  
  scale_order = c("first_genes", "first_cells"),  
  verbose = F  
)
```

Arguments

|                   |  |
|-------------------|--|
| gobject           | giotto object  |
| norm_methods      | normalization method to use                          |
| library_size_norm | normalize cells by library size                      |
| scalefactor       | scale factor to use after library size normalization |
| log_norm          | transform values to log-scale                        |
| logbase           | log base to use to log normalize expression values   |
| scale_genes       | z-score genes over all cells                         |
| scale_cells       | z-score cells over all genes                         |
| scale_order       | order to scale genes and cells                       |
| verbose           | be verbose   |

**Details**

Currently there are two 'methods' to normalize your raw counts data.

A. The standard method follows the standard protocol which can be adjusted using the provided parameters and follows the following order:

- 1. Data normalization for total library size and scaling by a custom scale-factor.
- 2. Log transformation of data.
- 3. Z-scoring of data by genes and/or cells.

B. The normalization method as provided by the osmFISH paper is also implemented:

- 1. First normalize genes, for each gene divide the counts by the total gene count and multiply by the total number of genes.
- 2. Next normalize cells, for each cell divide the normalized gene counts by the total counts per cell and multiply by the total number of cells.

This data will be saved in the Giotto slot for custom expression.

**Value**

giotto object

**Examples**

```
normalizeGiotto(gobject)
```

---

OR\_function2

*OR\_function2*

---

**Description**

calculate odds-ratio

**Usage**

```
OR_function2(A, B, C, D)
```

PAGEEnrich

*PAGEEnrich***Description**

Function to calculate gene signature enrichment scores per spatial position using PAGE.

**Usage**

```
PAGEEnrich(
  gobject,
  sign_matrix,
  expression_values = c("normalized", "scaled", "custom"),
  reverse_log_scale = TRUE,
  logbase = 2,
  output_enrichment = c("original", "zscore")
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | Giotto object  |
| <code>sign_matrix</code>       | Matrix of signature genes for each cell type / process   |
| <code>expression_values</code> | expression values to use                                 |
| <code>reverse_log_scale</code> | reverse expression values from log scale                 |
| <code>logbase</code>           | log base to use if <code>reverse_log_scale = TRUE</code> |
| <code>output_enrichment</code> | how to return enrichment output                          |

**Details**

`sign_matrix`: a binary matrix with genes as row names and cell-types as column names. Alternatively a list of signature genes can be provided to `makeSignMatrixPAGE`, which will create the matrix for you.

The enrichment Z score is calculated by using method (PAGE) from Kim SY et al., BMC bioinformatics, 2005 as  $Z = ((Sm \sim \mu) * m^{1/2}) / \delta$ . For each gene in each spot,  $\mu$  is the fold change values versus the mean expression and  $\delta$  is the standard deviation.  $Sm$  is the mean fold change value of a specific marker gene set and  $m$  is the size of a given marker gene set.

**Value**

data.table with enrichment results

**See Also**

[makeSignMatrixPAGE](#)

**Examples**

```
PAGEEnrich(gobject)
```

---

pDataDT

*pDataDT*

---

### Description

show cell metadata

### Usage

```
pDataDT(gobject)
```

### Arguments

gobject                  giotto object

### Value

data.table with cell metadata

### Examples

```
pDataDT(gobject)
```

---

plotCPGscores

*plotCPGscores*

---

### Description

Create heatmap from cell-cell proximity scores

### Usage

```
plotCPGscores(  
  CPGscores,  
  selected_interactions = NULL,  
  selected_genes = NULL,  
  detail_plot = T,  
  simple_plot = F,  
  simple_plot_facet = c("interaction", "genes"),  
  facet_scales = "fixed",  
  facet_ncol = length(selected_genes),  
  facet_nrow = length(selected_interactions),  
  show_plot = F  
)
```

Arguments

- CPGscores CPGscores, output from getCellProximityGeneScores()
- selected\_interactions interactions to show
- selected\_genes genes to show
- detail\_plot show detailed info in both interacting cell types
- simple\_plot show a simplified plot
- simple\_plot\_facet facet on interactions or genes with simple plot
- facet\_scales ggplot facet scales paramter
- facet\_ncol ggplot facet ncol parameter
- facet\_nrow ggplot facet nrow parameter
- show\_plot show plot

Details

Give more details ...

Value

ggplot barplot

Examples

```
plotCPGscores(CPGscores)
```

---

|               |                      |
|---------------|----------------------|
| plotGTGscores | <i>plotGTGscores</i> |
|---------------|----------------------|

---

Description

Create heatmap from cell-cell proximity scores

Usage

```
plotGTGscores(  
  gobject,  
  GTGscore,  
  selected_interactions = NULL,  
  selected_gene_to_gene = NULL,  
  detail_plot = T,  
  simple_plot = F,  
  simple_plot_facet = c("interaction", "genes"),  
  facet_scales = "fixed",  
  facet_ncol = length(selected_gene_to_gene),  
  facet_nrow = length(selected_interactions),  
  colors = c("blue", "red"),  
  show_plot = NA,  
  return_plot = NA,  
)
```

```

    save_plot = NA,
    save_param = list(),
    default_save_name = "plotGTGscores"
  )

```

### Arguments

|                       |  |
|-----------------------|--|
| gobject               | giotto object  |
| GTGscore              | GTGscore, output from <code>getGeneToGeneScores()</code>                   |
| selected_interactions | interactions to show   |
| detail_plot           | show detailed info in both interacting cell types                          |
| simple_plot           | show a simplified plot   |
| simple_plot_facet     | facet on interactions or genes with simple plot                            |
| facet_scales          | ggplot facet scales paramter   |
| facet_ncol            | ggplot facet ncol parameter  |
| facet_nrow            | ggplot facet nrow parameter  |
| colors                | vector with 2 colors to represent respectively all and selected cells      |
| show_plot             | show plots   |
| return_plot           | return ggplot object   |
| save_plot             | directly save the plot [boolean]   |
| save_param            | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name     | default save name for saving, don't change, change save_name in save_param |
| selected_genes        | genes to show  |

  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "plotHeatmap"
)
```

## Arguments

|                                   |                                    |
|-----------------------------------|------------------------------------|
| <code>gobject</code>              | giotto object                      |
| <code>expression_values</code>    | expression values to use           |
| <code>genes</code>                | genes to use                       |
| <code>cluster_column</code>       | name of column to use for clusters |
| <code>cluster_order</code>        | method to determine cluster order  |
| <code>cluster_custom_order</code> | custom order for clusters          |
| <code>cluster_color_code</code>   | color code for clusters            |
| <code>cluster_cor_method</code>   | method for cluster correlation     |

|                       |  |
|-----------------------|--|
| cluster_hclust_method | method for hierarchical clustering of clusters                         |
| gene_order            | method to determine gene order   |
| gene_custom_order     | custom order for genes   |
| gene_cor_method       | method for gene correlation  |
| gene_hclust_method    | method for hierarchical clustering of genes                            |
| show_values           | which values to show on heatmap  |
| size_vertical_lines   | sizes for vertical lines   |
| gradient_colors       | colors for heatmap gradient  |
| gene_label_selection  | subset of genes to show on y-axis                                      |
| axis_text_y_size      | size for y-axis text   |
| legend_nrows          | number of rows for the cluster legend                                  |
| show_plot             | show plot  |
| return_plot           | return ggplot object   |
| save_plot             | directly save the plot [boolean]                                       |
| save_param            | list of saving parameters from <a href="#">all_plots_save_function</a> |
| default_save_name     | default save name  |

## Details

If you want to display many genes there are 2 ways to proceed:

- 1. set axis\_text\_y\_size to a really small value and show all genes
- 2. provide a subset of genes to display to gene\_label\_selection

## Value

ggplot

## Examples

```
plotHeatmap(gobject)
```

---

plotly\_axis\_scale\_2D    *plotly\_axis\_scale\_2D*

---

### Description

adjust the axis scale in 3D plotly plot

### Usage

```
plotly_axis_scale_2D(
  cell_locations,
  sdimx = NULL,
  sdimy = NULL,
  mode = c("cube", "real", "custom"),
  custom_ratio = NULL
)
```

### Arguments

|                |                                 |
|----------------|---------------------------------|
| cell_locations | spatial_loc in giotto object    |
| sdimx          | x axis of cell spatial location |
| sdimy          | y axis of cell spatial location |
| mode           | axis adjustment mode            |
| custom_ratio   | set the ratio artificially      |

### Value

edges in spatial grid as data.table()

### Examples

```
plotly_axis_scale_2D(gobject)
```

---

plotly\_axis\_scale\_3D    *plotly\_axis\_scale\_3D*

---

### Description

adjust the axis scale in 3D plotly plot

### Usage

```
plotly_axis_scale_3D(
  cell_locations,
  sdimx = NULL,
  sdimy = NULL,
  sdimz = NULL,
  mode = c("cube", "real", "custom"),
  custom_ratio = NULL
)
```

**Arguments**

cell\_locations    spatial\_loc in giotto object  
 sdimx            x axis of cell spatial location  
 sdimy            y axis of cell spatial location  
 sdimz            z axis of cell spatial location  
 mode             axis adjustment mode  
 custom\_ratio    set the ratio artificially

**Value**

edges in spatial grid as data.table()

**Examples**

```
plotly_axis_scale_3D(gobject)
```

---

|             |                    |
|-------------|--------------------|
| plotly_grid | <i>plotly_grid</i> |
|-------------|--------------------|

---

**Description**

provide grid segment to draw in plot\_ly()

**Usage**

```
plotly_grid(
  spatial_grid,
  x_start = "x_start",
  y_start = "y_start",
  x_end = "x_end",
  y_end = "y_end"
)
```

**Arguments**

spatial\_grid    spatial\_grid in giotto object

**Value**

edges in spatial grid as data.table()

**Examples**

```
plotly_grid(gobject)
```

---

|                |                       |
|----------------|-----------------------|
| plotly_network | <i>plotly_network</i> |
|----------------|-----------------------|

---

### Description

provide network segment to draw in 3D plot\_ly()

### Usage

```
plotly_network(
  network,
  x = "sdimx_begin",
  y = "sdimy_begin",
  z = "sdimz_begin",
  x_end = "sdimx_end",
  y_end = "sdimy_end",
  z_end = "sdimz_end"
)
```

### Arguments

gobject                  network in giotto object

### Value

edges in network as data.table()

### Examples

```
plotly_network(gobject)
```

---

|                          |                                 |
|--------------------------|---------------------------------|
| plotMetaDataCellsHeatmap | <i>plotMetaDataCellsHeatmap</i> |
|--------------------------|---------------------------------|

---

### Description

Creates heatmap for numeric cell metadata within aggregated clusters.

### Usage

```
plotMetaDataCellsHeatmap(
  gobject,
  metadata_cols = NULL,
  spat_enr_names = NULL,
  value_cols = NULL,
  first_meta_col = NULL,
  second_meta_col = NULL,
  show_values = c("zscores", "original", "zscores_rescaled"),
  custom_cluster_order = NULL,
```

```

clus_cor_method = "pearson",
clus_cluster_method = "complete",
custom_values_order = NULL,
values_cor_method = "pearson",
values_cluster_method = "complete",
midpoint = 0,
x_text_size = 8,
x_text_angle = 45,
y_text_size = 8,
strip_text_size = 8,
show_plot = NA,
return_plot = NA,
save_plot = NA,
save_param = list(),
default_save_name = "plotMetaDataCellsHeatmap"
)

```

### Arguments

|                      |  |
|----------------------|--|
| gobject              | giotto object  |
| metadata_cols        | annotation columns found in pDataDT(gobject)                               |
| spat_enr_names       | spatial enrichment results to include                                      |
| value_cols           | value columns to use   |
| first_meta_col       | if more than 1 metadata column, select the x-axis factor                   |
| second_meta_col      | if more than 1 metadata column, select the facetting factor                |
| show_values          | which values to show on heatmap  |
| custom_cluster_order | custom cluster order (default = NULL)                                      |
| clus_cor_method      | correlation method for clusters  |
| clus_cluster_method  | hierarchical cluster method for the clusters                               |
| midpoint             | midpoint of show_values  |
| x_text_size          | size of x-axis text  |
| x_text_angle         | angle of x-axis text   |
| y_text_size          | size of y-axis text  |
| strip_text_size      | size of strip text   |
| show_plot            | show plot  |
| return_plot          | return ggplot object   |
| save_plot            | directly save the plot [boolean]   |
| save_param           | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name    | default save name for saving, don't change, change save_name in save_param |
| custom_gene_order    | custom gene order (default = NULL)   |

gene\_cor\_method  
correlation method for genes

gene\_cluster\_method  
hierarchical cluster method for the genes

### Details

Creates heatmap for the average values of selected value columns in the different annotation groups.

### Value

ggplot or data.table

### See Also

[plotMetaDataHeatmap](#) for gene expression instead of numeric cell annotation data.

### Examples

```
plotMetaDataCellsHeatmap(gobject)
```

---

|                     |                            |

---

|         |                |
|---------|----------------|
| plotPCA | <i>plotPCA</i> |
|---------|----------------|

---

Description

Short wrapper for PCA visualization

Usage

```
plotPCA(gobject, dim_reduction_name = "pca", default_save_name = "PCA", ...)
```

Arguments

- gobject            giotto object
- dim\_reduction\_name            dimension reduction name
- default\_save\_name            default save name for saving, don't change, change save\_name in save\_param
- groub\_by            create multiple plots based on cell annotation column
- group\_by\_subset            subset the group\_by factor column
- dim1\_to\_use            dimension to use on x-axis
- dim2\_to\_use            dimension to use on y-axis
- spat\_enr\_names            names of spatial enrichment results to include
- show\_NN\_network            show underlying NN network
- nn\_network\_to\_use            type of NN network to use (kNN vs sNN)
- network\_name            name of NN network to use, if show\_NN\_network = TRUE
- cell\_color            color for cells (see details)
- color\_as\_factor            convert color column to factor
- cell\_color\_code            named vector with colors
- cell\_color\_gradient            vector with 3 colors for numeric data
- gradient\_midpoint            midpoint for color gradient
- gradient\_limits            vector with lower and upper limits

|                                  |  |
|----------------------------------|--|
| <code>select_cell_groups</code>  | select subset of cells/clusters based on <code>cell_color</code> parameter |
| <code>select_cells</code>        | select subset of cells based on cell IDs                                   |

## Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotPCA\\_3D](#)

## Value

ggplot

## Examples

```
plotPCA(gobject)
```

---

plotPCA\_2D

*plotPCA\_2D*

---

## Description

Short wrapper for PCA visualization

## Usage

```
plotPCA_2D(
  gobject,
  dim_reduction_name = "pca",
  default_save_name = "PCA_2D",
  ...
)
```

## Arguments

|                                  |  |
|----------------------------------|--|
| <code>gobject</code>             | giotto object  |
| <code>dim_reduction_name</code>  | dimension reduction name   |
| <code>default_save_name</code>   | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>groub_by</code>            | create multiple plots based on cell annotation column  |
| <code>group_by_subset</code>     | subset the <code>group_by</code> factor column   |
| <code>dim1_to_use</code>         | dimension to use on x-axis   |
| <code>dim2_to_use</code>         | dimension to use on y-axis   |
| <code>spat_enr_names</code>      | names of spatial enrichment results to include   |
| <code>show_NN_network</code>     | show underlying NN network   |
| <code>nn_network_to_use</code>   | type of NN network to use (kNN vs sNN)   |
| <code>network_name</code>        | name of NN network to use, if <code>show_NN_network = TRUE</code>                                    |
| <code>cell_color</code>          | color for cells (see details)  |
| <code>color_as_factor</code>     | convert color column to factor   |
| <code>cell_color_code</code>     | named vector with colors   |
| <code>cell_color_gradient</code> | vector with 3 colors for numeric data  |
| <code>gradient_midpoint</code>   | midpoint for color gradient  |
| <code>gradient_limits</code>     | vector with lower and upper limits   |
| <code>select_cell_groups</code>  | select subset of cells/clusters based on <code>cell_color</code> parameter                           |

|                     |  |
|---------------------|--|
| select_cells        | select subset of cells based on cell IDs                               |
| show_other_cells    | display not selected cells   |
| other_cell_color    | color of not selected cells  |
| other_point_size    | size of not selected cells   |
| show_cluster_center | plot center of selected clusters                                       |
| show_center_label   | plot label of selected clusters  |
| center_point_size   | size of center points  |
| label_size          | size of labels   |
| label_fontface      | font of labels   |
| edge_alpha          | column to use for alpha of the edges                                   |
| point_shape         | point with border or not (border or no_border)                         |
| point_size          | size of point (cell)   |
| point_border_col    | color of border around points  |
| point_border_stroke | stroke size of border around points                                    |
| title               | title for plot, defaults to cell_color parameter                       |
| show_legend         | show legend  |
| legend_text         | size of legend text  |
| axis_text           | size of axis text  |
| axis_title          | size of axis title   |
| cow_n_col           | cowplot param: how many columns  |
| cow_rel_h           | cowplot param: relative height   |
| cow_rel_w           | cowplot param: relative width  |
| cow_align           | cowplot param: how to align  |
| show_plot           | show plot  |
| return_plot         | return ggplot object   |
| save_plot           | directly save the plot [boolean]                                       |
| save_param          | list of saving parameters from <a href="#">all_plots_save_function</a> |

### Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotPCA\\_3D](#)

### Value

ggplot

### Examples

```
plotPCA_2D(gobject)
```

plotPCA\_3D

*plotPCA\_3D***Description**

Visualize cells according to 3D PCA dimension reduction

**Usage**

```
plotPCA_3D(
  gobject,
  dim_reduction_name = "pca",
  default_save_name = "PCA_3D",
  ...
)
```

**Arguments**

|                     |  |
|---------------------|--|
| gobject             | giotto object  |
| dim_reduction_name  | pca dimension reduction name   |
| default_save_name   | default save name for saving, ideally change save_name in save_param |
| dim1_to_use         | dimension to use on x-axis   |
| dim2_to_use         | dimension to use on y-axis   |
| dim3_to_use         | dimension to use on z-axis   |
| show_NN_network     | show underlying NN network   |
| nn_network_to_use   | type of NN network to use (kNN vs sNN)                               |
| network_name        | name of NN network to use, if show_NN_network = TRUE                 |
| cell_color          | color for cells (see details)  |
| color_as_factor     | convert color column to factor                                       |
| cell_color_code     | named vector with colors   |
| select_cell_groups  | select subset of cells/clusters based on cell_color parameter        |
| select_cells        | select subset of cells based on cell IDs                             |
| show_other_cells    | display not selected cells   |
| other_cell_color    | color of not selected cells  |
| other_point_size    | size of not selected cells   |
| show_cluster_center | plot center of selected clusters                                     |

|                   |  |
|-------------------|--|
| show_center_label | plot label of selected clusters  |
| center_point_size | size of center points  |
| label_size        | size of labels   |
| edge_alpha        | column to use for alpha of the edges                                   |
| point_size        | size of point (cell)   |
| show_legend       | show legend  |
| show_plot         | show plot  |
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]                                       |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a> |

**Details**

Description of parameters.

**Value**

plotly

**Examples**

```
plotPCA_3D(gobject)
```

---

|          |                 |
|----------|-----------------|
| plotTSNE | <i>plotTSNE</i> |
|----------|-----------------|

---

**Description**

Short wrapper for tSNE visualization

**Usage**

```
plotTSNE(gobject, dim_reduction_name = "tsne", default_save_name = "tSNE", ...)
```

**Arguments**

|                    |  |
|--------------------|--|
| gobject            | giotto object  |
| dim_reduction_name | dimension reduction name   |
| default_save_name  | default save name for saving, don't change, change save_name in save_param |
| groub_by           | create multiple plots based on cell annotation column                      |
| group_by_subset    | subset the group_by factor column  |
| dim1_to_use        | dimension to use on x-axis   |

|                     |   |
|---------------------|---|
| dim2_to_use         | dimension to use on y-axis                                    |
| spat_enr_names      | names of spatial enrichment results to include                |
| show_NN_network     | show underlying NN network                                    |
| nn_network_to_use   | type of NN network to use (kNN vs sNN)                        |
| network_name        | name of NN network to use, if show_NN_network = TRUE          |
| cell_color          | color for cells (see details)                                 |
| color_as_factor     | convert color column to factor                                |
| cell_color_code     | named vector with colors                                      |
| cell_color_gradient | vector with 3 colors for numeric data                         |
| gradient_midpoint   | midpoint for color gradient                                   |
| gradient_limits     | vector with lower and upper limits                            |
| select_cell_groups  | select subset of cells/clusters based on cell_color parameter |
| select_cells        | select subset of cells based on cell IDs                      |
| show_other_cells    | display not selected cells                                    |
| other_cell_color    | color of not selected cells                                   |
| other_point_size    | size of not selected cells                                    |
| show_cluster_center | plot center of selected clusters                              |
| show_center_label   | plot label of selected clusters                               |
| center_point_size   | size of center points   |
| label_size          | size of labels  |
| label_fontface      | font of labels  |
| edge_alpha          | column to use for alpha of the edges                          |
| point_shape         | point with border or not (border or no_border)                |
| point_size          | size of point (cell)  |
| point_border_col    | color of border around points                                 |
| point_border_stroke | stroke size of border around points                           |
| title               | title for plot, defaults to cell_color parameter              |
| show_legend         | show legend   |
| legend_text         | size of legend text   |
| axis_text           | size of axis text   |

|             |  |
|-------------|--|
| axis_title  | size of axis title   |
| cow_n_col   | cowplot param: how many columns  |
| cow_rel_h   | cowplot param: relative height   |
| cow_rel_w   | cowplot param: relative width  |
| cow_align   | cowplot param: how to align  |
| show_plot   | show plot  |
| return_plot | return ggplot object   |
| save_plot   | directly save the plot [boolean]                                       |
| save_param  | list of saving parameters from <a href="#">all_plots_save_function</a> |

### Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotTSNE\\_3D](#)

### Value

ggplot

### Examples

```
plotTSNE(gobject)
```

---

|             |                    |
|-------------|--------------------|
| plotTSNE_2D | <i>plotTSNE_2D</i> |
|-------------|--------------------|

---

### Description

Short wrapper for tSNE visualization

### Usage

```
plotTSNE_2D(
  gobject,
  dim_reduction_name = "tsne",
  default_save_name = "tSNE_2D",
  ...
)
```

### Arguments

|                    |  |
|--------------------|--|
| gobject            | giotto object  |
| dim_reduction_name | dimension reduction name   |
| default_save_name  | default save name for saving, don't change, change save_name in save_param |
| groub_by           | create multiple plots based on cell annotation column                      |
| group_by_subset    | subset the group_by factor column  |

|                     |   |
|---------------------|---|
| dim1_to_use         | dimension to use on x-axis                                    |
| dim2_to_use         | dimension to use on y-axis                                    |
| spat_enr_names      | names of spatial enrichment results to include                |
| show_NN_network     | show underlying NN network                                    |
| nn_network_to_use   | type of NN network to use (kNN vs sNN)                        |
| network_name        | name of NN network to use, if show_NN_network = TRUE          |
| cell_color          | color for cells (see details)                                 |
| color_as_factor     | convert color column to factor                                |
| cell_color_code     | named vector with colors                                      |
| cell_color_gradient | vector with 3 colors for numeric data                         |
| gradient_midpoint   | midpoint for color gradient                                   |
| gradient_limits     | vector with lower and upper limits                            |
| select_cell_groups  | select subset of cells/clusters based on cell_color parameter |
| select_cells        | select subset of cells based on cell IDs                      |
| show_other_cells    | display not selected cells                                    |
| other_cell_color    | color of not selected cells                                   |
| other_point_size    | size of not selected cells                                    |
| show_cluster_center | plot center of selected clusters                              |
| show_center_label   | plot label of selected clusters                               |
| center_point_size   | size of center points   |
| label_size          | size of labels  |
| label_fontface      | font of labels  |
| edge_alpha          | column to use for alpha of the edges                          |
| point_shape         | point with border or not (border or no_border)                |
| point_size          | size of point (cell)  |
| point_border_col    | color of border around points                                 |
| point_border_stroke | stroke size of border around points                           |
| title               | title for plot, defaults to cell_color parameter              |
| show_legend         | show legend   |
| legend_text         | size of legend text   |

|             |  |
|-------------|--|
| axis_text   | size of axis text  |
| axis_title  | size of axis title   |
| cow_n_col   | cowplot param: how many columns  |
| cow_rel_h   | cowplot param: relative height   |
| cow_rel_w   | cowplot param: relative width  |
| cow_align   | cowplot param: how to align  |
| show_plot   | show plot  |
| return_plot | return ggplot object   |
| save_plot   | directly save the plot [boolean]                                       |
| save_param  | list of saving parameters from <a href="#">all_plots_save_function</a> |

### Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotTSNE\\_3D](#)

### Value

ggplot

### Examples

```
plotTSNE_2D(gobject)
```

---

|             |                    |
|-------------|--------------------|
| plotTSNE_3D | <i>plotTSNE_3D</i> |
|-------------|--------------------|

---

### Description

Visualize cells according to dimension reduction coordinates

### Usage

```
plotTSNE_3D(
  gobject,
  dim_reduction_name = "tsne",
  default_save_name = "TSNE_3D",
  ...
)
```

### Arguments

|                    |  |
|--------------------|--|
| gobject            | giotto object  |
| dim_reduction_name | tsne dimension reduction name  |
| default_save_name  | default save name for saving, don't change, change save_name in save_param |
| dim1_to_use        | dimension to use on x-axis   |
| dim2_to_use        | dimension to use on y-axis   |

|                     |  |
|---------------------|--|
| dim3_to_use         | dimension to use on z-axis   |
| show_NN_network     | show underlying NN network   |
| nn_network_to_use   | type of NN network to use (kNN vs sNN)                                 |
| network_name        | name of NN network to use, if show_NN_network = TRUE                   |
| cell_color          | color for cells (see details)  |
| color_as_factor     | convert color column to factor   |
| cell_color_code     | named vector with colors   |
| select_cell_groups  | select subset of cells/clusters based on cell_color parameter          |
| select_cells        | select subset of cells based on cell IDs                               |
| show_other_cells    | display not selected cells   |
| other_cell_color    | color of not selected cells  |
| other_point_size    | size of not selected cells   |
| show_cluster_center | plot center of selected clusters                                       |
| show_center_label   | plot label of selected clusters  |
| center_point_size   | size of center points  |
| label_size          | size of labels   |
| edge_alpha          | column to use for alpha of the edges                                   |
| point_size          | size of point (cell)   |
| show_legend         | show legend  |
| show_plot           | show plot  |
| return_plot         | return ggplot object   |
| save_plot           | directly save the plot [boolean]                                       |
| save_param          | list of saving parameters from <a href="#">all_plots_save_function</a> |

### Details

Description of parameters.

### Value

plotly

### Examples

```
plotTSNE_3D(gobject)
```

---

plotUMAP

*plotUMAP*

---

## Description

Short wrapper for UMAP visualization

## Usage

```
plotUMAP(gobject, dim_reduction_name = "umap", default_save_name = "UMAP", ...)
```

## Arguments

|                                  |  |
|----------------------------------|--|
| <code>gobject</code>             | giotto object  |
| <code>dim_reduction_name</code>  | dimension reduction name   |
| <code>default_save_name</code>   | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>groub_by</code>            | create multiple plots based on cell annotation column  |
| <code>group_by_subset</code>     | subset the <code>group_by</code> factor column   |
| <code>dim1_to_use</code>         | dimension to use on x-axis   |
| <code>dim2_to_use</code>         | dimension to use on y-axis   |
| <code>spat_enr_names</code>      | names of spatial enrichment results to include   |
| <code>show_NN_network</code>     | show underlying NN network   |
| <code>nn_network_to_use</code>   | type of NN network to use (kNN vs sNN)   |
| <code>network_name</code>        | name of NN network to use, if <code>show_NN_network</code> = TRUE                                    |
| <code>cell_color</code>          | color for cells (see details)  |
| <code>color_as_factor</code>     | convert color column to factor   |
| <code>cell_color_code</code>     | named vector with colors   |
| <code>cell_color_gradient</code> | vector with 3 colors for numeric data  |
| <code>gradient_midpoint</code>   | midpoint for color gradient  |
| <code>gradient_limits</code>     | vector with lower and upper limits   |
| <code>select_cell_groups</code>  | select subset of cells/clusters based on <code>cell_color</code> parameter                           |
| <code>select_cells</code>        | select subset of cells based on cell IDs   |
| <code>show_other_cells</code>    | display not selected cells   |
| <code>other_cell_color</code>    | color of not selected cells  |

|                     |  |
|---------------------|--|
| other_point_size    | size of not selected cells   |
| show_cluster_center | plot center of selected clusters                                       |
| show_center_label   | plot label of selected clusters  |
| center_point_size   | size of center points  |
| label_size          | size of labels   |
| label_fontface      | font of labels   |
| edge_alpha          | column to use for alpha of the edges                                   |
| point_shape         | point with border or not (border or no_border)                         |
| point_size          | size of point (cell)   |
| point_border_col    | color of border around points  |
| point_border_stroke | stroke size of border around points                                    |
| title               | title for plot, defaults to cell_color parameter                       |
| show_legend         | show legend  |
| legend_text         | size of legend text  |
| axis_text           | size of axis text  |
| axis_title          | size of axis title   |
| cow_n_col           | cowplot param: how many columns  |
| cow_rel_h           | cowplot param: relative height   |
| cow_rel_w           | cowplot param: relative width  |
| cow_align           | cowplot param: how to align  |
| show_plot           | show plot  |
| return_plot         | return ggplot object   |
| save_plot           | directly save the plot [boolean]                                       |
| save_param          | list of saving parameters from <a href="#">all_plots_save_function</a> |

## Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotUMAP\\_3D](#)

## Value

ggplot

## Examples

```
plotUMAP(gobject)
```

---

|             |                    |
|-------------|--------------------|
| plotUMAP_2D | <i>plotUMAP_2D</i> |
|-------------|--------------------|

---

## Description

Short wrapper for UMAP visualization

## Usage

```
plotUMAP_2D(
  gobject,
  dim_reduction_name = "umap",
  default_save_name = "UMAP_2D",
  ...
)
```

## Arguments

|                                  |  |
|----------------------------------|--|
| <code>gobject</code>             | giotto object  |
| <code>dim_reduction_name</code>  | dimension reduction name   |
| <code>default_save_name</code>   | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>groub_by</code>            | create multiple plots based on cell annotation column  |
| <code>group_by_subset</code>     | subset the <code>group_by</code> factor column   |
| <code>dim1_to_use</code>         | dimension to use on x-axis   |
| <code>dim2_to_use</code>         | dimension to use on y-axis   |
| <code>spat_enr_names</code>      | names of spatial enrichment results to include   |
| <code>show_NN_network</code>     | show underlying NN network   |
| <code>nn_network_to_use</code>   | type of NN network to use (kNN vs sNN)   |
| <code>network_name</code>        | name of NN network to use, if <code>show_NN_network = TRUE</code>                                    |
| <code>cell_color</code>          | color for cells (see details)  |
| <code>color_as_factor</code>     | convert color column to factor   |
| <code>cell_color_code</code>     | named vector with colors   |
| <code>cell_color_gradient</code> | vector with 3 colors for numeric data  |
| <code>gradient_midpoint</code>   | midpoint for color gradient  |
| <code>gradient_limits</code>     | vector with lower and upper limits   |
| <code>select_cell_groups</code>  | select subset of cells/clusters based on <code>cell_color</code> parameter                           |

|                                  |  |
|----------------------------------|--|
| <code>select_cells</code>        | select subset of cells based on cell IDs                               |
| <code>show_other_cells</code>    | display not selected cells   |
| <code>other_cell_color</code>    | color of not selected cells  |
| <code>other_point_size</code>    | size of not selected cells   |
| <code>show_cluster_center</code> | plot center of selected clusters                                       |
| <code>show_center_label</code>   | plot label of selected clusters  |
| <code>center_point_size</code>   | size of center points  |
| <code>label_size</code>          | size of labels   |
| <code>label_fontface</code>      | font of labels   |
| <code>edge_alpha</code>          | column to use for alpha of the edges                                   |
| <code>point_shape</code>         | point with border or not (border or no_border)                         |
| <code>point_size</code>          | size of point (cell)   |
| <code>point_border_col</code>    | color of border around points  |
| <code>point_border_stroke</code> | stroke size of border around points                                    |
| <code>title</code>               | title for plot, defaults to cell_color parameter                       |
| <code>show_legend</code>         | show legend  |
| <code>legend_text</code>         | size of legend text  |
| <code>axis_text</code>           | size of axis text  |
| <code>axis_title</code>          | size of axis title   |
| <code>cow_n_col</code>           | cowplot param: how many columns  |
| <code>cow_rel_h</code>           | cowplot param: relative height   |
| <code>cow_rel_w</code>           | cowplot param: relative width  |
| <code>cow_align</code>           | cowplot param: how to align  |
| <code>show_plot</code>           | show plot  |
| <code>return_plot</code>         | return ggplot object   |
| <code>save_plot</code>           | directly save the plot [boolean]                                       |
| <code>save_param</code>          | list of saving parameters from <a href="#">all_plots_save_function</a> |

### Details

Description of parameters, see [dimPlot2D](#). For 3D plots see [plotUMAP\\_3D](#)

### Value

ggplot

### Examples

```
plotUMAP_2D(gobject)
```

---

plotUMAP\_3D

*plotUMAP\_3D*

---

## Description

Visualize cells according to dimension reduction coordinates

## Usage

```
plotUMAP_3D(
  gobject,
  dim_reduction_name = "umap",
  default_save_name = "UMAP_3D",
  ...
)
```

## Arguments

|                                  |  |
|----------------------------------|--|
| <code>gobject</code>             | giotto object  |
| <code>dim_reduction_name</code>  | umap dimension reduction name  |
| <code>default_save_name</code>   | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>dim1_to_use</code>         | dimension to use on x-axis   |
| <code>dim2_to_use</code>         | dimension to use on y-axis   |
| <code>dim3_to_use</code>         | dimension to use on z-axis   |
| <code>show_NN_network</code>     | show underlying NN network   |
| <code>nn_network_to_use</code>   | type of NN network to use (kNN vs sNN)   |
| <code>network_name</code>        | name of NN network to use, if <code>show_NN_network</code> = TRUE                                    |
| <code>cell_color</code>          | color for cells (see details)  |
| <code>color_as_factor</code>     | convert color column to factor   |
| <code>cell_color_code</code>     | named vector with colors   |
| <code>select_cell_groups</code>  | select subset of cells/clusters based on <code>cell_color</code> parameter                           |
| <code>select_cells</code>        | select subset of cells based on cell IDs   |
| <code>show_other_cells</code>    | display not selected cells   |
| <code>other_cell_color</code>    | color of not selected cells  |
| <code>other_point_size</code>    | size of not selected cells   |
| <code>show_cluster_center</code> | plot center of selected clusters   |

|                   |  |
|-------------------|--|
| show_center_label | plot label of selected clusters  |
| center_point_size | size of center points  |
| label_size        | size of labels   |
| edge_alpha        | column to use for alpha of the edges                                   |
| point_size        | size of point (cell)   |
| show_legend       | show legend  |
| show_plot         | show plot  |
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]                                       |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a> |

**Details**

Description of parameters.

**Value**

plotly

**Examples**

```
plotUMAP_3D(gobject)
```

---

```
plot_network_layer_ggplot
      plot_network_layer_ggplot
```

---

**Description**

Visualize cells in network layer according to dimension reduction coordinates

**Usage**

```
plot_network_layer_ggplot(
  ggobject,
  annotated_network_DT,
  edge_alpha = NULL,
  show_legend = T
)
```

**Arguments**

|                      |  |
|----------------------|--|
| annotated_network_DT | annotated network data.table of selected cells |
| edge_alpha           | alpha of network edges                         |
| show_legend          | show legend                                    |
| gobject              | giotto object                                  |

**Details**

Description of parameters.

**Value**

ggplot

**Examples**

```
plot_network_layer_ggplot(gobject)
```

---

```
plot_point_layer_ggplot
```

```
plot_point_layer_ggplot
```

---

**Description**

Visualize cells in point layer according to dimension reduction coordinates

**Usage**

```
plot_point_layer_ggplot(
  ggobject,

```

## Arguments

|                                  |  |
|----------------------------------|--|
| sdinx                            | x-axis dimension name (default = 'sdinx')  |
| sdimy                            | y-axis dimension name (default = 'sdimy')  |
| cell_locations_metadata_selected | annotated location from selected cells     |
| cell_locations_metadata_other    | annotated location from non-selected cells |
| cell_color                       | color for cells (see details)              |
| color_as_factor                  | convert color column to factor             |
| cell_color_code                  | named vector with colors                   |

|                     |   |
|---------------------|---|
| cell_color_gradient | vector with 3 colors for numeric data                         |
| gradient_midpoint   | midpoint for color gradient                                   |
| gradient_limits     | vector with lower and upper limits                            |
| select_cell_groups  | select subset of cells/clusters based on cell_color parameter |
| select_cells        | select subset of cells based on cell IDs                      |
| point_size          | size of point (cell)  |
| show_cluster_center | plot center of selected clusters                              |
| show_center_label   | plot label of selected clusters                               |
| center_point_size   | size of center points   |
| label_size          | size of labels  |
| label_fontface      | font of labels  |
| show_other_cells    | display not selected cells                                    |
| other_cell_color    | color for not selected cells                                  |
| other_point_size    | point size for not selected cells                             |
| show_legend         | show legend   |
| gobject             | giotto object   |

### Details

Description of parameters.

### Value

ggplot

### Examples

```
plot_spat_point_layer_ggplot_noFILL(gobject)
```

---

|              |                                      |
|--------------|--------------------------------------|
| print.giotto | <i>print method for giotto class</i> |
|--------------|--------------------------------------|

---

### Description

print method for giotto class. Prints the chosen number of genes (rows) and cells (columns) from the raw count matrix. Also print the spatial locations for the chosen number of cells.

**Usage**

```
print.giotto(object, ...)
```

**Arguments**

|          |                                    |
|----------|------------------------------------|
| nr_genes | number of genes (rows) to print    |
| nr_cells | number of cells (columns) to print |

---

|            |                   |
|------------|-------------------|
| rankEnrich | <i>rankEnrich</i> |
|------------|-------------------|

---

**Description**

Function to calculate gene signature enrichment scores per spatial position using a rank based approach.

**Usage**

```
rankEnrich(
  gobject,
  sign_matrix,
  expression_values = c("normalized", "scaled", "custom"),
  reverse_log_scale = TRUE,
  logbase = 2,
  output_enrichment = c("original", "zscore")
)
```

**Arguments**

|                   |  |
|-------------------|--|
| gobject           | Giotto object  |
| sign_matrix       | Matrix of signature genes for each cell type / process |
| expression_values | expression values to use                               |
| reverse_log_scale | reverse expression values from log scale               |
| logbase           | log base to use if reverse_log_scale = TRUE            |
| output_enrichment | how to return enrichment output                        |

**Details**

sign\_matrix: a rank-fold matrix with genes as row names and cell-types as column names. Alternatively a scRNA-seq matrix and vector with clusters can be provided to makeSignMatrixRank, which will create the matrix for you.

First a new rank is calculated as  $R = (R1 * R2)^{(1/2)}$ , where R1 is the rank of fold-change for each gene in each spot and R2 is the rank of each marker in each cell type. The Rank-Biased Precision is then calculated as:  $RBP = (1 - 0.99) * (0.99)^{(R - 1)}$  and the final enrichment score is then calculated as the sum of top 100 RBPs.

**Value**

data.table with enrichment results

**See Also**

[makeSignMatrixRank](#)

**Examples**

```
rankEnrich(gobject)
```

---

|                      |                             |
|----------------------|-----------------------------|
| rankSpatialCorGroups | <i>rankSpatialCorGroups</i> |
|----------------------|-----------------------------|

---

**Description**

Rank spatial correlated clusters according to correlation structure

**Usage**

```
rankSpatialCorGroups(
  gobject,
  spatCorObject,
  use_clus_name = NULL,
  show_plot = NA,
  return_plot = FALSE,
  save_plot = NA,
  save_param = list(),
  default_save_name = "rankSpatialCorGroups"
)
```

**Arguments**

|                   |  |
|-------------------|--|
| gobject           | giotto object  |
| spatCorObject     | spatial correlation object   |
| use_clus_name     | name of clusters to visualize (from clusterSpatialCorGenes())              |
| show_plot         | show plot  |
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]   |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name | default save name for saving, don't change, change save_name in save_param |

**Value**

data.table with positive (within group) and negative (outside group) scores

**Examples**

```
rankSpatialCorGroups(gobject)
```

---

|               |                      |
|---------------|----------------------|
| rank_binarize | <i>rank_binarize</i> |
|---------------|----------------------|

---

**Description**

create binarized scores using arbitrary rank of top genes

**Usage**

```
rank_binarize(x, max_rank = 200)
```

---

|                        |                               |
|------------------------|-------------------------------|
| readGiottoInstructions | <i>readGiottoInstructions</i> |
|------------------------|-------------------------------|

---

**Description**

Retrieves the instruction associated with the provided parameter

**Usage**

```
readGiottoInstructions(giotto_instructions, param = NULL)
```

**Arguments**

|                     |   |
|---------------------|---|
| giotto_instructions | giotto object or result from createGiottoInstructions() |
| param               | parameter to retrieve                                   |

**Value**

specific parameter

**Examples**

```
readGiottoInstructions()
```

---

|                      |                             |
|----------------------|-----------------------------|
| removeCellAnnotation | <i>removeCellAnnotation</i> |
|----------------------|-----------------------------|

---

**Description**

removes cell annotation of giotto object

**Usage**

```
removeCellAnnotation(gobject, columns = NULL, return_gobject = TRUE)
```

**Arguments**

|                |  |
|----------------|--|
| gobject        | giotto object                                  |
| columns        | names of columns to remove                     |
| return_gobject | boolean: return giotto object (default = TRUE) |

**Details**

if return\_gobject = FALSE, it will return the cell metadata

**Value**

giotto object

**Examples**

```
removeCellAnnotation(gobject)
```

---

|                      |                             |
|----------------------|-----------------------------|
| removeGeneAnnotation | <i>removeGeneAnnotation</i> |
|----------------------|-----------------------------|

---

**Description**

removes gene annotation of giotto object

**Usage**

```
removeGeneAnnotation(gobject, columns = NULL, return_gobject = TRUE)
```

**Arguments**

|                |  |
|----------------|--|
| gobject        | giotto object                                  |
| columns        | names of columns to remove                     |
| return_gobject | boolean: return giotto object (default = TRUE) |

**Details**

if return\_gobject = FALSE, it will return the gene metadata

**Value**

giotto object

**Examples**

```
removeGeneAnnotation(gobject)
```

---

```
replaceGiottoInstructions
      replaceGiottoInstructions
```

---

**Description**

Function to replace all instructions from giotto object

**Usage**

```
replaceGiottoInstructions(gobject, instructions = NULL)
```

**Arguments**

|                           |  |
|---------------------------|--|
| <code>gobject</code>      | giotto object  |
| <code>instructions</code> | new instructions (e.g. result from <code>createGiottoInstructions</code> ) |

**Value**

named vector with giotto instructions

**Examples**

```
replaceGiottoInstructions()
```

---

```
runPCA      runPCA
```

---

**Description**

runs a Principal Component Analysis

**Usage**

```
runPCA(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  reduction = c("cells", "genes"),
  name = "pca",
  genes_to_use = NULL,
  return_gobject = TRUE,
  scale_unit = F,
  ncp = 200,
  ...
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object                                  |
| <code>expression_values</code> | expression values to use                       |
| <code>reduction</code>         | cells or genes                                 |
| <code>name</code>              | arbitrary name for PCA run                     |
| <code>genes_to_use</code>      | subset of genes to use for PCA                 |
| <code>return_gobject</code>    | boolean: return giotto object (default = TRUE) |
| <code>scale_unit</code>        | scale features before PCA                      |
| <code>ncp</code>               | number of principal components to calculate    |
| <code>...</code>               | additional parameters for PCA (see details)    |

**Details**

See [PCA](#) for more information about other parameters.

**Value**

giotto object with updated PCA dimension reduction

**Examples**

```
runPCA(gobject)
```

---

|                      |                |
|----------------------|----------------|
| <code>runtSNE</code> | <i>runtSNE</i> |
|----------------------|----------------|

---

**Description**

run tSNE

**Usage**

```
runtSNE(  
  gobject,  
  expression_values = c("normalized", "scaled", "custom"),  
  reduction = c("cells", "genes"),  
  dim_reduction_to_use = "pca",  
  dim_reduction_name = "pca",  
  dimensions_to_use = 1:10,  
  name = "tsne",  
  genes_to_use = NULL,  
  return_gobject = TRUE,  
  dims = 2,  
  perplexity = 30,  
  theta = 0.5,  
  do_PCA_first = F,  
  set_seed = T,  
  seed_number = 1234,  
  ...  
)
```

## Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>expression_values</code>    | expression values to use   |
| <code>reduction</code>            | cells or genes   |
| <code>dim_reduction_to_use</code> | use another dimension reduction set as input                     |
| <code>dim_reduction_name</code>   | name of dimension reduction set to use                           |
| <code>dimensions_to_use</code>    | number of dimensions to use as input                             |
| <code>name</code>                 | arbitrary name for tSNE run                                      |
| <code>genes_to_use</code>         | if <code>dim_reduction_to_use = NULL</code> , which genes to use |
| <code>return_gobject</code>       | boolean: return giotto object (default = TRUE)                   |
| <code>dims</code>                 | tSNE param: number of dimensions to return                       |
| <code>perplexity</code>           | tSNE param: perplexity   |
| <code>theta</code>                | tSNE param: theta  |
| <code>do_PCA_first</code>         | tSNE param: do PCA before tSNE (default = FALSE)                 |
| <code>set_seed</code>             | use of seed  |
| <code>seed_number</code>          | seed number to use   |
| <code>...</code>                  | additional tSNE parameters                                       |

## Details

See [Rtsne](#) for more information about these and other parameters.

- Input for tSNE dimension reduction can be another dimension reduction (default = 'pca')
- To use gene expression as input set `dim_reduction_to_use = NULL`
- multiple tSNE results can be stored by changing the *name* of the analysis

## Value

giotto object with updated tSNE dimension reduction

## Examples

```
runtSNE(gobject)
```

runUMAP

*runUMAP***Description**

run UMAP

**Usage**

```
runUMAP(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  reduction = c("cells", "genes"),
  dim_reduction_to_use = "pca",
  dim_reduction_name = "pca",
  dimensions_to_use = 1:10,
  name = "umap",
  genes_to_use = NULL,
  return_gobject = TRUE,
  n_neighbors = 40,
  n_components = 2,
  n_epochs = 400,
  min_dist = 0.01,
  n_threads = 1,
  spread = 5,
  set_seed = T,
  seed_number = 1234,
  ...
)
```

**Arguments**

|                      |  |
|----------------------|--|
| gobject              | giotto object                                      |
| expression_values    | expression values to use                           |
| reduction            | cells or genes                                     |
| dim_reduction_to_use | use another dimension reduction set as input       |
| dim_reduction_name   | name of dimension reduction set to use             |
| dimensions_to_use    | number of dimensions to use as input               |
| name                 | arbitrary name for UMAP run                        |
| genes_to_use         | if dim_reduction_to_use = NULL, which genes to use |
| return_gobject       | boolean: return giotto object (default = TRUE)     |
| n_neighbors          | UMAP param: number of neighbors                    |
| n_components         | UMAP param: number of components                   |
| n_epochs             | UMAP param: number of epochs                       |

|             |                              |
|-------------|------------------------------|
| min_dist    | UMAP param: minimum distance |
| n_threads   | UMAP param: threads to use   |
| spread      | UMAP param: spread           |
| set_seed    | use of seed                  |
| seed_number | seed number to use           |
| ...         | additional UMAP parameters   |

### Details

See [umap](#) for more information about these and other parameters.

- Input for UMAP dimension reduction can be another dimension reduction (default = 'pca')
- To use gene expression as input set `dim_reduction_to_use = NULL`
- multiple UMAP results can be stored by changing the *name* of the analysis

### Value

giotto object with updated UMAP dimension reduction

### Examples

```
runUMAP(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| selectPatternGenes | <i>selectPatternGenes</i> |
|--------------------|---------------------------|

---

### Description

Select genes correlated with spatial patterns

### Usage

```
selectPatternGenes(
  spatPatObj,
  dimensions = 1:5,
  top_pos_genes = 10,
  top_neg_genes = 10,
  min_pos_cor = 0.5,
  min_neg_cor = -0.5,
  return_top_selection = FALSE
)
```

### Arguments

|               |   |
|---------------|---|
| spatPatObj    | Output from detectSpatialPatterns                     |
| dimensions    | dimensions to identify correlated genes for.          |
| top_pos_genes | Top positively correlated genes.                      |
| top_neg_genes | Top negatively correlated genes.                      |
| min_pos_cor   | Minimum positive correlation score to include a gene. |
| min_neg_cor   | Minimum negative correlation score to include a gene. |

**Details**

Description.

**Value**

Data.table with genes associated with selected dimension (PC).

**Examples**

```
selectPatternGenes(gobject)
```

---

```
select_expression_values  
      select_expression_values
```

---

**Description**

helper function to select expression values

**Usage**

```
select_expression_values(gobject, values)
```

**Arguments**

|                      |                              |
|----------------------|------------------------------|
| <code>gobject</code> | giotto object                |
| <code>values</code>  | expression values to extract |

**Value**

expression matrix

---

```
show,giotto-method      show method for giotto class
```

---

**Description**

show method for giotto class

**Usage**

```
## S4 method for signature 'giotto'  
show(object)
```

---

showClusterDendrogram *showClusterDendrogram*

---

## Description

Creates dendrogram for selected clusters.

## Usage

```
showClusterDendrogram(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  cluster_column,
  cor = c("pearson", "spearman"),
  distance = "ward.D",
  h = NULL,
  h_color = "red",
  rotate = FALSE,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "showClusterDendrogram",
  ...
)
```

## Arguments

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object  |
| <code>expression_values</code> | expression values to use   |
| <code>cluster_column</code>    | name of column to use for clusters   |
| <code>cor</code>               | correlation score to calculate distance  |
| <code>distance</code>          | distance method to use for hierarchical clustering   |
| <code>h</code>                 | height of horizontal lines to plot   |
| <code>h_color</code>           | color of horizontal lines  |
| <code>rotate</code>            | rotate dendrogram 90 degrees   |
| <code>show_plot</code>         | show plot  |
| <code>return_plot</code>       | return ggplot object   |
| <code>save_plot</code>         | directly save the plot [boolean]   |
| <code>save_param</code>        | list of saving parameters from <a href="#">all_plots_save_function</a>                               |
| <code>default_save_name</code> | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |
| <code>...</code>               | additional parameters for <code>ggdendrogram()</code>  |

## Details

Expression correlation dendrogram for selected clusters.

**Value**

ggplot

**Examples**

```
showClusterDendrogram(gobject)
```

---

|                    |                           |
|--------------------|---------------------------|
| showClusterHeatmap | <i>showClusterHeatmap</i> |
|--------------------|---------------------------|

---

**Description**

Creates heatmap based on identified clusters

**Usage**

```
showClusterHeatmap(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  genes = "all",
  cluster_column,
  cor = c("pearson", "spearman"),
  distance = "ward.D",
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "showClusterHeatmap",
  ...
)
```

**Arguments**

|                   |  |
|-------------------|--|
| gobject           | giotto object  |
| expression_values | expression values to use   |
| genes             | vector of genes to use, default to 'all'                                   |
| cluster_column    | name of column to use for clusters   |
| cor               | correlation score to calculate distance                                    |
| distance          | distance method to use for hierarchical clustering                         |
| show_plot         | show plot  |
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]   |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name | default save name for saving, don't change, change save_name in save_param |
| ...               | additional parameters for the Heatmap function from ComplexHeatmap         |

Details

Correlation heatmap of selected clusters.

Value

ggplot

Examples

```
showClusterHeatmap(gobject)
```

---

|               |                      |
|---------------|----------------------|
| showCPGscores | <i>showCPGscores</i> |
|---------------|----------------------|

---

Description

visualize Cell Proximity Gene enrichment scores

Usage

```
showCPGscores(  
  gobject,  
  CPGscore,  
  method = c("volcano", "cell_barplot", "cell-cell", "cell_sankey"),  
  min_cells = 5,

Value

ggplot barplot

**Examples**

```
showGeneExpressionProximityScore(scores)
```

---

```
showGiottoInstructions
      showGiottoInstructions
```

---

**Description**

Function to display all instructions from giotto object

**Usage**

```
showGiottoInstructions(gobject)
```

**Arguments**

gobject                  giotto object

**Value**

named vector with giotto instructions

**Examples**

```
showGiottoInstructions()
```

---

```
showGTGscores                  showGTGscores
```

---

**Description**

visualize Cell Proximity Gene enrichment scores

**Usage**

```
showGTGscores(
  GTGscore,
  method = c("cell_barplot", "cell-cell", "cell_sankey"),
  min_cells = 5,
  min_pval = 0.05,
  min_spat_diff = 0.2,
  min_log2_fc = 0.5,
  direction = c("both", "up", "down"),
  cell_color_code = NULL,
  show_plot = T,
  specific_genes_1 = NULL,
  specific_genes_2 = NULL,
  first_cell_name = "ligand cell",
  second_cell_name = "receptor cell",
  return_DT = F
)
```

**Arguments**

|                  |  |

**Value**

ggplot

**Examples**

```
showGTGscores(CPGscore)
```

---

```
showIntExpressionProximityScore
```

```
showIntExpressionProximityScore
```

---

**Description**

Create heatmap from cell-cell proximity scores

**Usage**

```
showIntExpressionProximityScore(
  scores,
  selected_interaction,
  sort_column = "diff_spat",
  show_enriched_n = 5,
  show_depleted_n = 5
)
```

Arguments

- scores                    scores, output from getAverageCellProximityGeneScores()
- selected\_interaction       interaction to show
- sort\_column            column name to use for sorting
- show\_enriched\_n           show top enriched interactions
- show\_depleted\_n           show top depleted interactions

Description

show patterns for 2D spatial data

Usage

```
showPattern(gobject, spatPatObj, ...)
```

Arguments

- gobject                    giotto object
- spatPatObj                Output from detectSpatialPatterns
- dimension                dimension to plot
- trim                      Trim ends of the PC values.
- background\_color           background color for plot
- grid\_border\_color           color for grid
- show\_legend            show legend of ggplot
- show\_plot                show plot
- return\_plot            return ggplot object
- save\_plot                directly save the plot [boolean]
- save\_param            list of saving parameters from [all\\_plots\\_save\\_function](#)
- default\_save\_name        default save name for saving, don't change, change save\_name in save\_param

Value

ggplot

  spatPatObj,
  dimension = 1,
  top_pos_genes = 5,
  top_neg_genes = 5,
  point_size = 1,
  return_DT = FALSE,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "showPatternGenes"
)
```

**Arguments**

|                                |  |
|--------------------------------|--|
| <code>gobject</code>           | giotto object  |
| <code>spatPatObj</code>        | Output from <code>detectSpatialPatterns</code>   |
| <code>dimension</code>         | dimension to plot genes for.   |
| <code>top_pos_genes</code>     | Top positively correlated genes.   |
| <code>top_neg_genes</code>     | Top negatively correlated genes.   |
| <code>point_size</code>        | size of points   |
| <code>return_DT</code>         | if TRUE, it will return the data.table used to generate the plots                                    |
| <code>show_plot</code>         | show plot  |
| <code>return_plot</code>       | return ggplot object   |
| <code>save_plot</code>         | directly save the plot [boolean]   |
| <code>save_param</code>        | list of saving parameters from <code>all_plots_save_function()</code>                                |
| <code>default_save_name</code> | default save name for saving, don't change, change <code>save_name</code> in <code>save_param</code> |

**Value**

ggplot

**Examples**

```
showPatternGenes(gobject)
```

---

|                                  |                            |
|----------------------------------|----------------------------|
| <code>showProcessingSteps</code> | <i>showProcessingSteps</i> |
|----------------------------------|----------------------------|

---

**Description**

shows the sequential processing steps that were performed in a summarized format

**Usage**

```
showProcessingSteps(gobject)
```

**Arguments**

|                      |               |
|----------------------|---------------|
| <code>gobject</code> | giotto object |
|----------------------|---------------|

**Value**

list of processing steps and names

**Examples**

```
showProcessingSteps(gobject)
```

---

|                     |                            |
|---------------------|----------------------------|
| showSpatialCorGenes | <i>showSpatialCorGenes</i> |
|---------------------|----------------------------|

---

## Description

Shows and filters spatially correlated genes

## Usage

```
showSpatialCorGenes(
  spatCorObject,
  use_clus_name = NULL,
  selected_clusters = NULL,
  genes = NULL,
  min_spat_cor = 0.5,
  min_expr_cor = NULL,
  min_cor_diff = NULL,
  min_rank_diff = NULL,
  show_top_genes = NULL
)
```

## Arguments

|                   |   |
|-------------------|---|
| spatCorObject     | spatial correlation object  |
| use_clus_name     | cluster information to show   |
| selected_clusters | subset of clusters to show  |
| genes             | subset of genes to show   |
| min_spat_cor      | filter on minimum spatial correlation                                 |
| min_expr_cor      | filter on minimum single-cell expression correlation                  |
| min_cor_diff      | filter on minimum correlation difference (spatial vs expression)      |
| min_rank_diff     | filter on minimum correlation rank difference (spatial vs expression) |
| show_top_genes    | show top genes per gene   |

## Value

data.table with filtered information

## Examples

```
showSpatialCorGenes(gobject)
```

---

|                   |                          |
|-------------------|--------------------------|
| showTopGeneToGene | <i>showTopGeneToGene</i> |
|-------------------|--------------------------|

---

**Description**

Show enriched/depleted gene-gene enrichments

**Usage**

```
showTopGeneToGene(  
  GTGscore,  
  top_interactions = 10,  
  direction = c("increased", "decreased"),  
  complement_data = T,  
  subset_cell_ints = NULL,  
  subset_genes = NULL  
)
```

**Arguments**

- GTGscore            GTGscore, output from getGeneToGeneScores()
- top\_interactions    number of top gene-gene enrichments to show
- direction           show top increased or decreased gene-gene enrichments
- complement\_data    include non-enriched gene-gene scores from other cell-cell interactions
- subset\_cell\_ints    subset cell-cell interactions to show
- subset\_genes        subset genes to show

**Details**

Give more details ...

**Value**

ggplot barplot

**Examples**

```
showTopGeneToGene(scores)
```

signPCA

*signPCA***Description**

identify significant principal components (PCs)

**Usage**

```
signPCA(
  gobject,
  method = c("screeplot", "jackstraw"),
  expression_values = c("normalized", "scaled", "custom"),
  reduction = c("cells", "genes"),
  genes_to_use = NULL,
  scale_unit = T,
  ncp = 50,
  scree_labels = T,
  scree_ylim = c(0, 10),
  jack_iter = 10,
  jack_threshold = 0.01,
  jack_verbose = T,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "signPCA",
  ...
)
```

**Arguments**

|                                |   |
|--------------------------------|---|
| <code>gobject</code>           | giotto object                               |
| <code>method</code>            | method to use to identify significant PCs   |
| <code>expression_values</code> | expression values to use                    |
| <code>reduction</code>         | cells or genes                              |
| <code>genes_to_use</code>      | subset of genes to use for PCA              |
| <code>scale_unit</code>        | scale features before PCA                   |
| <code>ncp</code>               | number of principal components to calculate |
| <code>scree_labels</code>      | show labels on scree plot                   |
| <code>scree_ylim</code>        | y-axis limits on scree plot                 |
| <code>jack_iter</code>         | number of iterations for jackstraw          |
| <code>jack_threshold</code>    | p-value threshold to call a PC significant  |
| <code>jack_verbose</code>      | show progress of jackstraw method           |
| <code>show_plot</code>         | show plot                                   |
| <code>return_plot</code>       | return ggplot object                        |

```

save_plot      directly save the plot [boolean]
save_param     list of saving parameters from all_plots_save_function()
default_save_name
                default save name for saving, don't change, change save_name in save_param
...            additional parameters for PCA

```

## Details

Two different methods can be used to assess the number of relevant or significant principal components (PC's).

1. Screeplot works by plotting the explained variance of each individual PC in a barplot allowing you to identify which PC does not show a significant contribution anymore (= 'elbow method').
2. The Jackstraw method uses the [permutationPA](#) function. By systematically permuting genes it identifies robust, and thus significant, PCs.

multiple PCA results can be stored by changing the *name* parameter

## Value

ggplot object for scree method and maxtrix of p-values for jackstraw

## Examples

```
signPCA(gobject)
```

---

|              |                     |

        provide a label for each cluster
    dim_center_point_size
        size of the center point
    dim_center_point_border_col
        border color of center point
    dim_center_point_border_stroke
        stroke size of center point
    dim_label_size
        size of the center label
    dim_label_fontface
        font of the center label
    spat_show_cluster_center
        show the center of each cluster
    spat_show_center_label
        provide a label for each cluster
    spat_center_point_size
        size of the center point
    spat_label_size
        size of the center label
    spat_label_fontface
        font of the center label
    show_NN_network
        show underlying NN network
    nn_network_to_use
        type of NN network to use (kNN vs sNN)
    nn_network_name
        name of NN network to use, if show_NN_network = TRUE
    dim_edge_alpha
        column to use for alpha of the edges
    spat_show_network
        show spatial network
    spatial_network_name
        name of spatial network to use
    spat_network_color
        color of spatial network
    spat_show_grid
        show spatial grid
    spatial_grid_name
        name of spatial grid to use
    spat_grid_color
        color of spatial grid
    show_other_cells
        display not selected cells
    other_cell_color
        color of not selected cells

```

|                        |  |
|------------------------|--|
| dim_other_point_size   | size of not selected dim cells   |
| spat_other_point_size  | size of not selected spat cells  |
| spat_other_cells_alpha | alpha of not selected spat cells   |
| coord_fix_ratio        | ratio for coordinates  |
| cow_n_col              | cowplot param: how many columns  |
| cow_rel_h              | cowplot param: relative height   |

| <code>dim_point_border_stroke</code> | border stroke of points in dim. reduction space                            |

```

spat_point_shape
    point with border or not (border or no_border)
spat_point_size
    size of spatial points
spat_point_border_col
    border color of spatial points
spat_point_border_stroke
    border stroke of spatial points
dim_show_cluster_center
    show the center of each cluster
dim_show_center_label
    provide a label for each cluster
dim_center_point_size
    size of the center point
dim_center_point_border_col
    border color of center point
dim_center_point_border_stroke
    stroke size of center point
dim_label_size
    size of the center label
dim_label_fontface
    font of the center label
spat_show_cluster_center
    show the center of each cluster
spat_show_center_label
    provide a label for each cluster
spat_center_point_size
    size of the center point
spat_label_size
    size of the center label
spat_label_fontface
    font of the center label
show_NN_network
    show underlying NN network
nn_network_to_use
    type of NN network to use (kNN vs sNN)
network_name
    name of NN network to use, if show_NN_network = TRUE
nn_network_alpha
    column to use for alpha of the edges
show_spatial_network
    show spatial network
spat_network_name
    name of spatial network to use
spat_network_color
    color of spatial network
show_spatial_grid
    show spatial grid
spat_grid_name
    name of spatial grid to use
spat_grid_color
    color of spatial grid

```

|                        |  |
|------------------------|--|
| show_other_cells       | display not selected cells   |
| other_cell_color       | color of not selected cells  |
| dim_other_point_size   | size of not selected dim cells   |
| spat_other_point_size  | size of not selected spat cells  |
| spat_other_cells_alpha | alpha of not selected spat cells   |
| dim_show_legend        | show legend of dimension reduction plot                                    |
| spat_show_legend       | show legend of spatial plot  |
| legend_text            | size of legend text  |
| axis_text              | size of axis text  |
| axis_title             | size of axis title   |
| show_plot              | show plot  |
| return_plot            | return ggplot object   |
| save_plot              | directly save the plot [boolean]   |
| save_param             | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name      | default save name for saving, don't change, change save_name in save_param |

## Details

Description of parameters.

## Value

ggplot

Details

Description of parameters.

Value

ggplot

Examples

spatGenePlot3D(gobject)

---

|             |                    |
|-------------|--------------------|
| Spatial_AEH | <i>Spatial_AEH</i> |
|-------------|--------------------|

---

Description

calculate automatic expression histology with spatialDE method

Usage

```
Spatial_AEH(  
  gobject = NULL,  
  results = NULL,  
  pattern_num = 5,  
  l = 1.05,  
  show_AEH = T,  
  sdimx = NULL,  
  sdimy = NULL,  
  point_size = 3,  
  point_alpha = 1,  
  low_color = "blue",  
  mid_color = "white",  
  high_color = "red",  
  midpoint = 0,  
  python_path = NULL  
)
```

Arguments

|             |   |
|-------------|---|
| gobject     | Giotto object                               |
| results     | output from spatial_DE                      |
| pattern_num | the number of gene expression patterns      |
| show_AEH    | show AEH plot                               |
| python_path | specify specific path to python if required |

Details

Description.

Value

a list or a dataframe of SVs

Examples

```
Spatial_AEH(gobject)
```

---

|            |                   |
|------------|-------------------|
| Spatial_DE | <i>Spatial_DE</i> |
|------------|-------------------|

---

Description

calculate spatial variable genes with spatialDE method

Usage

```
Spatial_DE(  
  gobject = NULL,  
  show_plot = T,  
  size = c(4, 2, 1),  
  color = c("blue", "green", "red"),  
  sig_alpha = 0.5,  
  unsig_alpha = 0.5,  
  python_path = NULL  
)
```

Arguments

- gobject            Giotto object
- show\_plot        show FSV plot
- python\_path      specify specific path to python if required

Details

Description.

Value

a list or a dataframe of SVs

Examples

```
Spatial_DE(gobject)
```

### Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object  |
| <code>sdimx</code>                | x-axis dimension name (default = 'sdimx')                                  |
| <code>sdimy</code>                | y-axis dimension name (default = 'sdimy')                                  |
| <code>spat_enr_names</code>       | names of spatial enrichment results to include                             |
| <code>cell_color</code>           | color for cells (see details)  |
| <code>color_as_factor</code>      | convert color column to factor   |
| <code>cell_color_code</code>      | named vector with colors   |
| <code>cell_color_gradient</code>  | vector with 3 colors for numeric data                                      |
| <code>gradient_midpoint</code>    | midpoint for color gradient  |
| <code>gradient_limits</code>      | vector with lower and upper limits   |
| <code>select_cell_groups</code>   | select subset of cells/clusters based on <code>cell_color</code> parameter |
| <code>select_cells</code>         | select subset of cells based on cell IDs                                   |
| <code>point_shape</code>          | point with border or not (border or no_border)                             |
| <code>point_size</code>           | size of point (cell)   |
| <code>point_border_col</code>     | color of border around points  |
| <code>point_border_stroke</code>  | stroke size of border around points  |
| <code>show_cluster_center</code>  | plot center of selected clusters   |
| <code>show_center_label</code>    | plot label of selected clusters  |
| <code>center_point_size</code>    | size of center points  |
| <code>label_size</code>           | size of labels   |
| <code>label_fontface</code>       | font of labels   |
| <code>show_network</code>         | show underlying spatial network  |
| <code>spatial_network_name</code> | name of spatial network to use   |
| <code>network_color</code>        | color of spatial network   |
| <code>network_alpha</code>        | alpha of spatial network   |
| <code>show_grid</code>            | show spatial grid  |

|                   |  |
|-------------------|--|
| spatial_grid_name | name of spatial grid to use  |
| grid_color        | color of spatial grid  |
| show_other_cells  | display not selected cells   |
| other_cell_color  | color of not selected cells  |
| other_point_size  | point size of not selected cells   |
| other_cells_alpha | alpha of not selected cells  |
| coord_fix_ratio   | fix ratio between x and y-axis   |
| title             | title of plot  |
| show_legend       | show legend  |
| legend_text       | size of legend text  |
| axis_text         | size of axis text  |
| axis_title        | size of axis title   |
| show_plot         | show plot  |
| return_plot       | return ggplot object   |
| save_plot         | directly save the plot [boolean]   |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name | default save name for saving, don't change, change save_name in save_param |

spatPlot3D(gobject)
```

---

```
specificCellCellcommunicationScores
      specificCellCellcommunicationScores
```

---

## Description

Specific Cell-Cell communication scores based on spatial expression of interacting cells

## Usage

```
specificCellCellcommunicationScores(
  gobject,
  spatial_network_name = "spatial_network",
  cluster_column = "cell_types",
  random_iter = 100,
  cell_type_1 = "astrocyte",
  cell_type_2 = "endothelial",
  gene_set_1,
  gene_set_2,
  log2FC_addendum = 0.1,
  min_observations = 2,
  verbose = T
)
```

## Arguments

|                                   |  |
|-----------------------------------|--|
| <code>gobject</code>              | giotto object to use                                     |
| <code>spatial_network_name</code> | spatial network to use for identifying interacting cells |
| <code>cluster_column</code>       | cluster column with cell type information                |
| <code>random_iter</code>          | number of iterations                                     |
| <code>cell_type_1</code>          | first cell type  |
| <code>cell_type_2</code>          | second cell type   |
| <code>gene_set_1</code>           | first specific gene set from gene pairs                  |
| <code>gene_set_2</code>           | second specific gene set from gene pairs                 |
| <code>log2FC_addendum</code>      | addendum to add when calculating log2FC                  |
| <code>min_observations</code>     | minimum number of interactions needed to be considered   |
| <code>verbose</code>              | verbose  |

## Details

Statistical framework to identify if pairs of genes (such as ligand-receptor combinations) are expressed at higher levels than expected based on a reshuffled null distribution of gene expression values in cells that are spatially in proximity to eachother.. More details will follow soon.

**Value**

Cell-Cell communication scores for gene pairs based on spatial interaction

**Examples**

```
specificCellCellcommunicationScores(gobject)
```

---

```
split_dendrogram_in_two
```

```
split_dendrogram_in_two
```

---

**Description**

Merge selected clusters based on pairwise correlation scores and size of cluster.

**Usage**

```
split_dendrogram_in_two(dend)
```

**Arguments**

dend                      dendrogram object

**Value**

list of two dendrograms and height of node

**Examples**

```
split_dendrogram_in_two(dend)
```

---

```
stitchFieldCoordinates
```

```
stitchFieldCoordinates
```

---

**Description**

Helper function to stitch field coordinates together to form one complete picture

**Usage**

```
stitchFieldCoordinates(
  location_file,
  offset_file,
  cumulate_offset_x = F,
  cumulate_offset_y = F,
  field_col = "Field of View",
  X_coord_col = "X",
  Y_coord_col = "Y",
  reverse_final_x = F,
  reverse_final_y = T
)
```

Arguments

- location\_file    location dataframe with X and Y coordinates
- offset\_file     dataframe that describes the offset for each field (see details)
- cumulate\_offset\_x  
                  (boolean) Do the x-axis offset values need to be cumulated?
- cumulate\_offset\_y  
                  (boolean) Do the y-axis offset values need to be cumulated?
- field\_col        column that indicates the field within the location\_file
- X\_coord\_col     column that indicates the x coordinates
- Y\_coord\_col     column that indicates the x coordinates
- reverse\_final\_x  
                  (boolean) Do the final x coordinates need to be reversed?
- reverse\_final\_y  
                  (boolean) Do the final y coordinates need to be reversed?

Details

- Stitching of fields:
- 1. have cell locations: at least 3 columns: field, X, Y
  - 2. create offset file: offset file has 3 columns: field, x\_offset, y\_offset
  - 3. create new cell location file by stitching original cell locations with stitchFieldCoordinates
  - 4. provide new cell location file to [createGiottoObject](#)

Value

Updated location dataframe with new X ['X\_final'] and Y ['Y\_final'] coordinates

Examples

```
stitchFieldCoordinates(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| subClusterCells | <i>subClusterCells</i> |
|-----------------|------------------------|

---

Description

subcluster cells

Usage

```
subClusterCells(  
  gobject,  
  name = "sub_clus",  
  cluster_method = c("leiden", "louvain_community", "louvain_multinet"),  
  cluster_column = NULL,  
  selected_clusters = NULL,  
  hvg_param = list(reverse_log_scale = T, difference_in_variance = 1, expression_values  
    = "normalized"),
```

```

    hvg_min_perc_cells = 5,
    hvg_mean_expr_det = 1,
    use_all_genes_as_hvg = FALSE,
    min_nr_of_hvg = 5,
    pca_param = list(expression_values = "normalized", scale_unit = T),
    nn_param = list(dimensions_to_use = 1:20),
    k_neighbors = 10,
    resolution = 1,
    gamma = 1,
    omega = 1,
    python_path = NULL,
    nn_network_to_use = "sNN",
    network_name = "sNN.pca",
    return_gobject = TRUE,
    verbose = T
)

```

### Arguments

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object   |
| <code>name</code>                 | name for new clustering result                                    |
| <code>cluster_method</code>       | clustering method to use  |
| <code>cluster_column</code>       | cluster column to subcluster                                      |
| <code>selected_clusters</code>    | only do subclustering on these clusters                           |
| <code>hvg_param</code>            | parameters for calculateHVG                                       |
| <code>hvg_min_perc_cells</code>   | threshold for detection in min percentage of cells                |
| <code>hvg_mean_expr_det</code>    | threshold for mean expression level in cells with detection       |
| <code>use_all_genes_as_hvg</code> | forces all genes to be HVG and to be used as input for PCA        |
| <code>min_nr_of_hvg</code>        | minimum number of HVG, or all genes will be used as input for PCA |
| <code>pca_param</code>            | parameters for runPCA   |
| <code>nn_param</code>             | parameters for parameters for createNearestNetwork                |
| <code>k_neighbors</code>          | number of k for createNearestNetwork                              |
| <code>resolution</code>           | resolution  |
| <code>gamma</code>                | gamma   |
| <code>omega</code>                | omega   |
| <code>python_path</code>          | specify specific path to python if required                       |
| <code>nn_network_to_use</code>    | type of NN network to use (kNN vs sNN)                            |
| <code>network_name</code>         | name of NN network to use   |
| <code>return_gobject</code>       | boolean: return giotto object (default = TRUE)                    |
| <code>verbose</code>              | verbose   |

**Details**

This function performs subclustering on selected clusters. The systematic steps are:

- 1. subset Giotto object
- 2. identify highly variable genes
- 3. run PCA
- 4. create nearest neighbouring network
- 5. do clustering

**Value**

giotto object with new subclusters appended to cell metadata

**See Also**

[doLouvainCluster\\_multinet](#), [doLouvainCluster\\_community](#) and [@seealso doLeidenCluster](#)

**Examples**

```
subClusterCells(gobject)
```

---

|              |                     |
|--------------|---------------------|
| subsetGiotto | <i>subsetGiotto</i> |
|--------------|---------------------|

---

**Description**

subsets Giotto object including previous analyses.

**Usage**

```
subsetGiotto(gobject, cell_ids = NULL, gene_ids = NULL, verbose = FALSE)
```

**Arguments**

|          |                  |
|----------|------------------|
| gobject  | giotto object    |
| cell_ids | cell IDs to keep |
| gene_ids | gene IDs to keep |
| verbose  | be verbose       |

**Value**

giotto object

**Examples**

```
subsetGiotto(gobject)
```

---

|                  |                         |
|------------------|-------------------------|
| subsetGiottoLocs | <i>subsetGiottoLocs</i> |
|------------------|-------------------------|

---

## Description

subsets Giotto object based on spatial locations

## Usage

```
subsetGiottoLocs(  
  gobject,  
  x_max = NULL,  
  x_min = NULL,  
  y_max = NULL,  
  y_min = NULL,  
  z_max = NULL,  
  z_min = NULL,  
  return_gobject = T,  
  verbose = FALSE  
)
```

## Arguments

|                             |                      |
|-----------------------------|----------------------|
| <code>gobject</code>        | giotto object        |
| <code>x_max</code>          | maximum x-coordinate |
| <code>x_min</code>          | minimum x-coordinate |
| <code>y_max</code>          | maximum y-coordinate |
| <code>y_min</code>          | minimum y-coordinate |
| <code>z_max</code>          | maximum z-coordinate |
| <code>z_min</code>          | minimum z-coordinate |
| <code>return_gobject</code> | return Giotto object |

## Details

if `return_gobject = FALSE`, then a filtered combined metadata `data.table` will be returned

## Value

giotto object

## Examples

```
subsetGiottoLocs(gobject)
```

---

|                 |                        |

viewHMRFresults3D(gobject)
```

---

violinPlot

*violinPlot*

---

## Description

Creates violinplot for selected clusters

## Usage

```
violinPlot(
  gobject,
  expression_values = c("normalized", "scaled", "custom"),
  genes,
  cluster_column,
  cluster_custom_order = NULL,
  color_violin = c("genes", "cluster"),
  cluster_color_code = NULL,
  strip_position = c("top", "right", "left", "bottom"),
  strip_text = 7,
  axis_text_x_size = 10,
  axis_text_y_size = 6,
  show_plot = NA,
  return_plot = NA,
  save_plot = NA,
  save_param = list(),
  default_save_name = "violinPlot"
)
```

## Arguments

|                      |   |
|----------------------|---|
| gobject              | giotto object                               |
| expression_values    | expression values to use                    |
| genes                | genes to plot                               |
| cluster_column       | name of column to use for clusters          |
| cluster_custom_order | custom order of clusters                    |
| color_violin         | color violin according to genes or clusters |
| cluster_color_code   | color code for clusters                     |
| strip_position       | position of gene labels                     |
| strip_text           | size of strip text                          |
| axis_text_x_size     | size of x-axis text                         |
| axis_text_y_size     | size of y-axis text                         |
| show_plot            | show plot                                   |
| return_plot          | return ggplot object                        |

|                   |  |
|-------------------|--|
| save_plot         | directly save the plot [boolean]   |
| save_param        | list of saving parameters from <a href="#">all_plots_save_function</a>     |
| default_save_name | default save name for saving, don't change, change save_name in save_param |

### Value

ggplot

### Examples

```
violinPlot(gobject)
```

---

|                |                       |
|----------------|-----------------------|
| visDimGenePlot | <i>visDimGenePlot</i> |
|----------------|-----------------------|

---

### Description

Visualize cells and gene expression according to dimension reduction coordinates

### Usage

```
visDimGenePlot(
  gobject,

  cow_rel_w = 1,
  cow_align = "h",
  show_legend = T,
  plot_method = c("ggplot", "plotly"),
  show_plots = F
)
```

**Arguments**

|  |   |
|--|---|
| <code>gobject</code>                     | giotto object   |
| <code>expression_values</code>           | gene expression values to use                                     |
| <code>genes</code>                       | genes to show   |
| <code>dim_reduction_to_use</code>        | dimension reduction to use  |
| <code>dim_reduction_name</code>          | dimension reduction name  |
| <code>dim1_to_use</code>                 | dimension to use on x-axis  |
| <code>dim2_to_use</code>                 | dimension to use on y-axis  |
| <code>dim3_to_use</code>                 | dimension to use on z-axis  |
| <code>show_NN_network</code>             | show underlying NN network  |
| <code>nn_network_to_use</code>           | type of NN network to use (kNN vs sNN)                            |
| <code>network_name</code>                | name of NN network to use, if <code>show_NN_network = TRUE</code> |
| <code>edge_alpha</code>                  | column to use for alpha of the edges                              |
| <code>scale_alpha_with_expression</code> | scale expression with ggplot alpha parameter                      |
| <code>point_size</code>                  | size of point (cell)  |
| <code>point_border_col</code>            | color of border around points                                     |
| <code>point_border_stroke</code>         | stroke size of border around points                               |
| <code>midpoint</code>                    | size of point (cell)  |
| <code>cow_n_col</code>                   | cowplot param: how many columns                                   |
| <code>cow_rel_h</code>                   | cowplot param: relative height                                    |
| <code>cow_rel_w</code>                   | cowplot param: relative width                                     |
| <code>cow_align</code>                   | cowplot param: how to align                                       |
| <code>show_legend</code>                 | show legend   |
| <code>show_plots</code>                  | show plots  |

| <code>other_point_size</code>     | size of not selected cells   |
| <code>show_cluster_center</code>  | plot center of selected clusters   |
| <code>show_center_label</code>    | plot label of selected clusters  |
| <code>center_point_size</code>    | size of center points  |

|                     |                                      |
|---------------------|--------------------------------------|
| label_size          | size of labels                       |
| label_fontface      | font of labels                       |
| edge_alpha          | column to use for alpha of the edges |
| point_size          | size of point (cell)                 |
| point_border_col    | color of border around points        |
| point_border_stroke | stroke size of border around points  |
| show_legend         | show legend                          |

## Details

Description of parameters.

## Value

ggplot

## Examples

```
visDimPlot_2D_ggplot(gobject)
```

---

visDimPlot\_2D\_plotly    *visDimPlot\_2D\_plotly*

---

## Description

Visualize cells according to dimension reduction coordinates

## Usage

```
visDimPlot_2D_plotly(
  gobject,
  dim_reduction_to_use = "umap",
  dim_reduction_name = "umap",
  dim1_to_use = 1,
  dim2_to_use = 2,
  select_cell_groups = NULL,
  select_cells = NULL,
  show_other_cells = T,
  other_cell_color = "lightgrey",
  other_point_size = 0.5,
  show_NN_network = F,
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  color_as_factor = T,
  cell_color = NULL,
  cell_color_code = NULL,
  show_cluster_center = F,
  show_center_label = T,
```

```

    center_point_size = 4,
    label_size = 4,
    edge_alpha = NULL,
    point_size = 5
  )

```

### Arguments

|                                   |   |
|-----------------------------------|---|
| <code>gobject</code>              | giotto object   |
| <code>dim_reduction_to_use</code> | dimension reduction to use  |
| <code>dim_reduction_name</code>   | dimension reduction name  |
| <code>dim1_to_use</code>          | dimension to use on x-axis  |
| <code>dim2_to_use</code>          | dimension to use on y-axis  |
| <code>show_NN_network</code>      | show underlying NN network  |
| <code>nn_network_to_use</code>    | type of NN network to use (kNN vs sNN)                            |
| <code>network_name</code>         | name of NN network to use, if <code>show_NN_network = TRUE</code> |
| <code>color_as_factor</code>      | convert color column to factor                                    |
| <code>cell_color</code>           | color for cells (see details)                                     |

| <code>genes_low_color</code>      | color represents low gene expression    |
| <code>spatial_grid_name</code>    | name of spatial grid to use             |
| <code>point_size</code>           | size of point (cell)                    |
| <code>show_legend</code>          | show legend                             |
| <code>axis_scale</code>           | three mode to adjust axis scale         |
| <code>x_ticks</code>              | number of ticks on x axis               |
| <code>y_ticks</code>              | number of ticks on y axis               |

|            |                                 |
|------------|---------------------------------|
| z_ticks    | number of ticks on z axis       |
| show_plots | show plots                      |
| grid_color | color of spatial grid           |
| cow_n_col  | cowplot param: how many columns |
| cow_rel_h  | cowplot param: relative height  |
| cow_rel_w  | cowplot param: relative width   |
| cow_align  | cowplot param: how to align     |

Details

Description of parameters.

Value

plotly

Examples

```
visGenePlot_3D_plotly(gobject)
```

---

|         |                |
|---------|----------------|
| visPlot | <i>visPlot</i> |
|---------|----------------|

---

Description

Visualize cells according to spatial coordinates

Usage

```
visPlot(  
  gobject,  
  sdimx = NULL,

|-----------------------|---|
| color_as_factor       | convert color column to factor                                |
| cell_color_code       | named vector with colors                                      |
| select_cell_groups    | select subset of cells/clusters based on cell_color parameter |
| select_cells          | select subset of cells based on cell IDs                      |
| show_other_cells      | display not selected cells                                    |
| other_cell_color      | color of not selected cells                                   |
| nn_network_alpha      | column to use for alpha of the edges                          |
| show_spatial_network  | show spatial network  |
| spatial_network_name  | name of spatial network to use                                |
| spatial_network_color | color of spatial network                                      |
| show_spatial_grid     | show spatial grid   |
| spatial_grid_name     | name of spatial grid to use                                   |
| spatial_grid_color    | color of spatial grid   |
| show_legend           | show legend   |
| show_plot             | show plot   |
| return_plot           | return ggplot object  |
| save_plot             | directly save the plot [boolean]                              |
| save_dir              | directory to save the plot                                    |
| save_folder           | (optional) folder in directory to save the plot               |
| save_name             | name of plot  |
| save_format           | format of plot (e.g. tiff, png, pdf, ...)                     |
| show_saved_plot       | load & display the saved plot                                 |

### Details

Description of parameters.

### Value

ggplot

### Examples

```
visSpatDimPlot_2D(gobject)
```

---

|                   |                          |
|-------------------|--------------------------|
| visSpatDimPlot_3D | <i>visSpatDimPlot_3D</i> |
|-------------------|--------------------------|

---

## Description

Visualize cells according to spatial AND dimension reduction coordinates in plotly mode

## Usage

```
visSpatDimPlot_3D(
  gobject,
  plot_alignment = c("horizontal", "vertical"),
  dim_reduction_to_use = "umap",
  dim_reduction_name = "umap",
  dim1_to_use = 1,
  dim2_to_use = 2,
  dim3_to_use = NULL,
  sdims = NULL,
  sdimsx = NULL,
  sdimsy = NULL,
  sdimsz = NULL,
  show_NN_network = F,
  nn_network_to_use = "sNN",
  network_name = "sNN.pca",
  show_cluster_center = F,
  show_center_label = T,
  center_point_size = 4,
  label_size = 16,
  cell_color = NULL,
  color_as_factor = T,
  cell_color_code = NULL,
  dim_point_size = 3,
  nn_network_alpha = 0.5,
  show_spatial_network = F,
  spatial_network_name = "spatial_network",
  network_color = "lightgray",
  spatial_network_alpha = 0.5,
  show_spatial_grid = F,
  spatial_grid_name = "spatial_grid",
  spatial_grid_color = NULL,
  spatial_grid_alpha = 0.5,
  spatial_point_size = 3,
  axis_scale = c("cube", "real", "custom"),
  custom_ratio = NULL,
  x_ticks = NULL,
  y_ticks = NULL,
  z_ticks = NULL,
  legend_text_size = 12
)
```

## Arguments

gobject                  giotto object

|                       |  |
|-----------------------|--|
| plot_alignment        | direction to align plot                              |
| dim_reduction_to_use  | dimension reduction to use                           |
| dim_reduction_name    | dimension reduction name                             |
| dim1_to_use           | dimension to use on x-axis                           |
| dim2_to_use           | dimension to use on y-axis                           |
| dim3_to_use           | dimension to use on z-axis                           |
| show_NN_network       | show underlying NN network                           |
| nn_network_to_use     | type of NN network to use (kNN vs sNN)               |
| network_name          | name of NN network to use, if show_NN_network = TRUE |
| cell_color            | color for cells (see details)                        |
| color_as_factor       | convert color column to factor                       |
| cell_color_code       | named vector with colors                             |
| nn_network_alpha      | column to use for alpha of the edges                 |
| show_spatial_network  | show spatial network                                 |
| spatial_network_name  | name of spatial network to use                       |
| spatial_network_alpha | alpha of spatial network                             |
| show_spatial_grid     | show spatial grid                                    |
| spatial_grid_name     | name of spatial grid to use                          |
| spatial_grid_color    | color of spatial grid                                |
| spatial_grid_alpha    | alpha of spatial grid                                |
| legend_text_size      | text size of legend                                  |
| spatial_network_color | color of spatial network                             |
| show_legend           | show legend  |
| show_plot             | show plot  |

## Details

Description of parameters.

## Value

plotly

**Examples**

```
visSpatDimPlot_3D(gobject)
```

---

|                 |                        |
|-----------------|------------------------|
| writeHMRResults | <i>writeHMRResults</i> |
|-----------------|------------------------|

---

**Description**

write results from doHMRF to a data.table.

**Usage**

```
writeHMRResults(
  gobject,
  HMRFoutput,
  k = NULL,
  betas_to_view = NULL,
  print_command = F
)
```

**Arguments**

|               |  |
|---------------|--|
| gobject       | giotto object                                      |
| HMRFoutput    | HMRF output from doHMRF                            |
| k             | k to write results for                             |
| betas_to_view | results from different betas that you want to view |
| print_command | see the python command                             |

**Value**

data.table with HMRF results for each b and the selected k

**Examples**

```
writeHMRResults(gobject)
```

---

|                                |                                       |
|--------------------------------|---------------------------------------|
| write_giotto_viewer_annotation | <i>write_giotto_viewer_annotation</i> |
|--------------------------------|---------------------------------------|

---

**Description**

write out factor-like annotation data from a giotto object for the Viewer

**Usage**

```
write_giotto_viewer_annotation(
  annotation,
  annot_name = "test",
  output_directory = getwd()
)
```

**Arguments**

|                  |   |
|------------------|---|
| annotation       | annotation from the data.table from giotto object |
| annot_name       | name of the annotation                            |
| output_directory | directory where to save the files                 |

**Value**

write a .txt and .annot file for the selection annotation

---

```
write_giotto_viewer_dim_reduction
      write_giotto_viewer_dim_reduction
```

---

**Description**

write out dimensional reduction data from a giotto object for the Viewer

**Usage**

```
write_giotto_viewer_dim_reduction(
  dim_reduction_cell,
  dim_red = NULL,
  dim_red_name = NULL,
  dim_red_rounding = NULL,
  dim_red_rescale = c(-20, 20),
  output_directory = getwd()
)
```

**Arguments**

|                    |   |
|--------------------|---|
| dim_reduction_cell | dimension reduction slot from giotto object       |
| dim_red            | high level name of dimension reduction            |
| dim_red_name       | specific name of dimension reduction to use       |
| dim_red_rounding   | numerical indicating how to round the coordinates |
| dim_red_rescale    | numericals to rescale the coordinates             |
| output_directory   | directory where to save the files                 |

**Value**

write a .txt and .annot file for the selection annotation

---

```
write_giotto_viewer_numeric_annotation  
    write_giotto_viewer_numeric_annotation
```

---

**Description**

write out numeric annotation data from a giotto object for the Viewer

**Usage**

```
write_giotto_viewer_numeric_annotation(  
  annotation,  
  annot_name = "test",  
  output_directory = getwd()  
)
```

**Arguments**

|                  |   |
|------------------|---|
| annotation       | annotation from the data.table from giotto object |
| annot_name       | name of the annotation                            |
| output_directory | directory where to save the files                 |

**Value**

write a .txt and .annot file for the selection annotation
